Important

Please Read Before Starting

This air conditioning system meets strict safety and operating standards. As the installer or service person, it is an important part of your job to install or service the system so it operates safely and efficiently.

For safe installation and trouble-free operation, you must :

- Carefully read this instruction booklet before beginning.
- Follow each installation or repair step exactly as shown.
- Observe all local, state, and national electrical codes.
- Pay close attention to all warning and caution notices given in this manual.

WARNING

This symbol refers to a hazard or unsafe practice which can result in severe personal injury or death.

CAUTION

This symbol refers to a hazard or unsafe practice which can result in personal injury or product or property damage.

If Necessary, Get Help

These instructions are all you need for most installation sites and maintenance conditions. If you require help for a special problem, contact our sales/service outlet or your certified dealer for additional instructions.

In Case of Improper Installation

The manufacturer shall in no way be responsible for improper installation or maintenance service, including failure to follow the instructions in this document.

SPECIAL PRECAUTIONS

When Wiring

ELECTRICAL SHOCK CAN CAUSE SEVERE PERSONAL INJURY OR DEATH. ONLY A QUALIFIED, EXPERIENCED ELECTRICIAN SHOULD ATTEMPT TO WIRE THIS SYSTEM.

- Do not supply power to the unit until all wiring and tubing are completed or reconnected and checked.
- Highly dangerous electrical voltages are used in this system. Carefully refer to the wiring diagram and these instructions when wiring. Improper connections and inadequate grounding can cause **accidental injury or death**.
- **Ground the unit** following local electrical codes.
- Connect all wiring tightly. Loose wiring may cause overheating at connection points and a possible fire hazard.

When Transporting

Be careful when picking up and moving the indoor and outdoor units. Get a partner to help, and bend your knees when lifting to reduce strain on your back. Sharp edges or thin aluminum fins on the air conditioner can cut your fingers.

When Installing

...In a Room

Properly insulate any tubing run inside a room to prevent "sweating" that can cause dripping and water damage to walls and floors.

...In Moist or Uneven Locations

Use a raised concrete pad or concrete blocks to provide a solid, level foundation for the outdoor unit. This prevents water damage and abnormal vibration.

...In an area with High Winds

Securely anchor the outdoor unit down with bolts and a metal frame. Provide a suitable air baffle.

...In a Snowy Area (for Heat Pump-type Systems)

Install the outdoor unit on a raised platform that is higher than drifting snow. Provide snow vents.

When Connecting Refrigerant Tubing

- Ventilate the room well, in the event that refrigerant gas leaks during the installation. Be careful not to allow contact of the refrigerant gas with a flame as this will cause the generation of poisonous gas.
- Keep all tubing runs as short as possible.
- Use the flare method for connecting tubing.
- Apply refrigerant lubricant to the matching surfaces of the flare and union tubes before connecting them, then tighten the nut with a torque wrench for a leak-free connection.
- Check carefully for leaks before starting the test run.

NOTE

Depending on the system type, liquid and gas lines may be either narrow or wide. Therefore, to avoid confusion the refrigerant tubing for your particular model is specified as either "narrow" or "wide" rather than as "liquid" or "gas".

When Servicing

- Turn the power OFF at the main power box (mains) before opening the unit to check or repair electrical parts and wiring.
- Keep your fingers and clothing away from any moving parts.
- Clean up the site when installation is finished. Check that no metal scraps or bits of wiring have been left inside the unit.

CAUTION

- Ventilate any enclosed areas when installing or testing the refrigeration system. Contact of refrigerant gas with fire or heat can produce poisonous gas.
- Confirm after installation that no refrigerant gas is leaking. If the gas comes in contact with a burning stove, gas water heater, electric room heater or other heat source, it can cause the generation of poisonous gas.

Check of Density Limit

WARNING

Do not install the indoor unit to the place, such as a basement, etc. where refrigerant can stay, since refrigerant is heavier than air.

The room in which the air conditioner is to be installed requires a design that in the event of refrigerant gas leaking out, its density will not exceed a set limit.

The refrigerant (R22/R407C) which is used in the air conditioner is safe, without the toxicity or combustibility of ammonia, and is not restricted by laws to be imposed which protect the ozone layer. However, since it contains more than air, it poses the risk of suffocation if its density should rise excessively. Suffocation from leakage of refrigerant is almost non-existent. With the recent increase in the number of high density buildings, however, the installation of multi air conditioner systems is on the increase because of the need for effective use of floor space, individual control, energy conservation by curtailing heat and carrying power etc.

Most importantly, the multi air conditioner system is able to replenish a large amount of refrigerant compared with conventional individual air conditioners. If a single unit of the multi air conditioner system is to be installed in a small room, select a suitable model and installation procedure so that if the refrigerant accidentally leaks out, its density does not reach the limit (and in the event of an emergency, measures can be made before injury can occur).

In a room where the density may exceed the limit, create an opening with adjacent rooms, or install mechanical ventilation combined with a gas leak detection device.

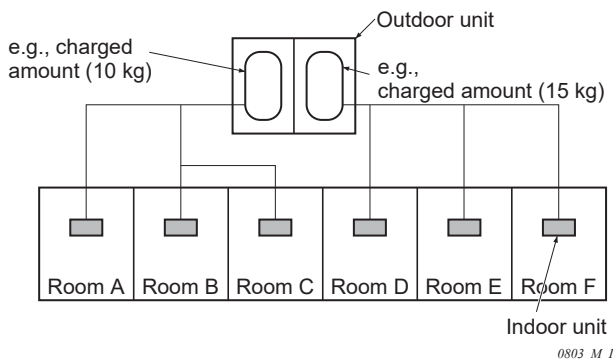

The density is as given below.

Total amount of refrigerant (kg)

Min. volume of the indoor unit installed room (m³)
 \leq Density limit (kg/m³)

The density limit of refrigerant which is used in multi air conditioners is 0.3 kg/m³ (ISO 5149).

NOTE 1 : If there are 2 or more refrigerating systems in a single refrigerating device, the amount of refrigerant should be as charged in each independent device.

For the amount of charge in this example:

The possible amount of leaked refrigerant gas in rooms A, B and C is 10 kg.

The possible amount of leaked refrigerant gas in rooms D, E and F is 15 kg.

NOTE 2 : The standards for minimum room volume are as follows.

(1) No partition (shaded portion)

(2) When there is an effective opening with the adjacent room for ventilation of leaking refrigerant gas (opening without a door, or an opening 0.15% or larger than the respective floor spaces at the top or bottom of the door).

(3) If an indoor unit is installed in each partitioned room and the refrigerant tubing is interconnected, the smallest room of course becomes the object. But when a mechanical ventilation is installed interlocked with a gas leakage detector in the smallest room where the density limit is exceeded, the volume of the next smallest room becomes the object.

NOTE 3 :

The minimum indoor floor space compared with the amount of refrigerant is roughly as follows: (When the ceiling is 2.7 m high)

2. Features of W-ECO MULTI SYSTEM

2-1. Outline of system

W-ECO MULTI is capable of controlling the capacity by 1 H.P. up to 30 H.P. without inverter control.

■ W-ECO multi system

Up to 30 H.P. (84 kW)

Connection

● SANYO makes it possible to link outdoor units together for a large 84 kW (30 H.P.) capacity (the largest in the market).

Limitation of system	
Allowable no. outdoor unit connected	2 units
Allowable max. capacity of outdoor unit	30 H.P. (84 kW)
Allowable No. of indoor unit connected	32 units
Indoor / outdoor unit capacity ratio	~ 130 %

Concentration

● Since all tubings are concentrated into one pipe shaft, you can minimize piping space and construction labor.

Addition

● If your indoor capacity load changes in the future, it's easy to add on both indoor and outdoor units using the same tubings.

■ Combination outdoor units

PC unit can be used independently or in combination with AD unit.

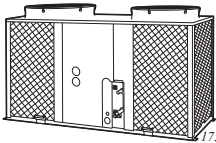

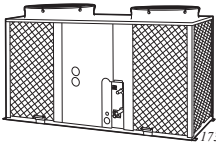

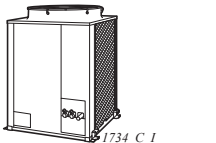

CAUTION

- AD (Additional) unit can not be used independently.
- R407C model and R22 model must not be used as a combination outdoor unit.

1754_M_1

Combination of outdoor units

No. of units to be combined	1 unit		2 units			
						
Cooling capacity kW (HP)	45 (16)	56 (20)	67.4 (24)	73 (26)	78.4 (28)	84 (30)
Power control outdoor unit (capacity control possible)	150 type	①	①	①		
	190 type		①		①	①
AD outdoor unit (capacity control not possible)	70 type		1		1	
	90 type			1		1

Design your outdoor unit however you want by combining power control units and AD units (up to 2 units) for a horsepower of up to 30 HP. And since you can set the unit capacity to match the indoor load, you can design your air conditioning system much more freely than before, as well as reduce your initial costs by designing the system just the way you want it.

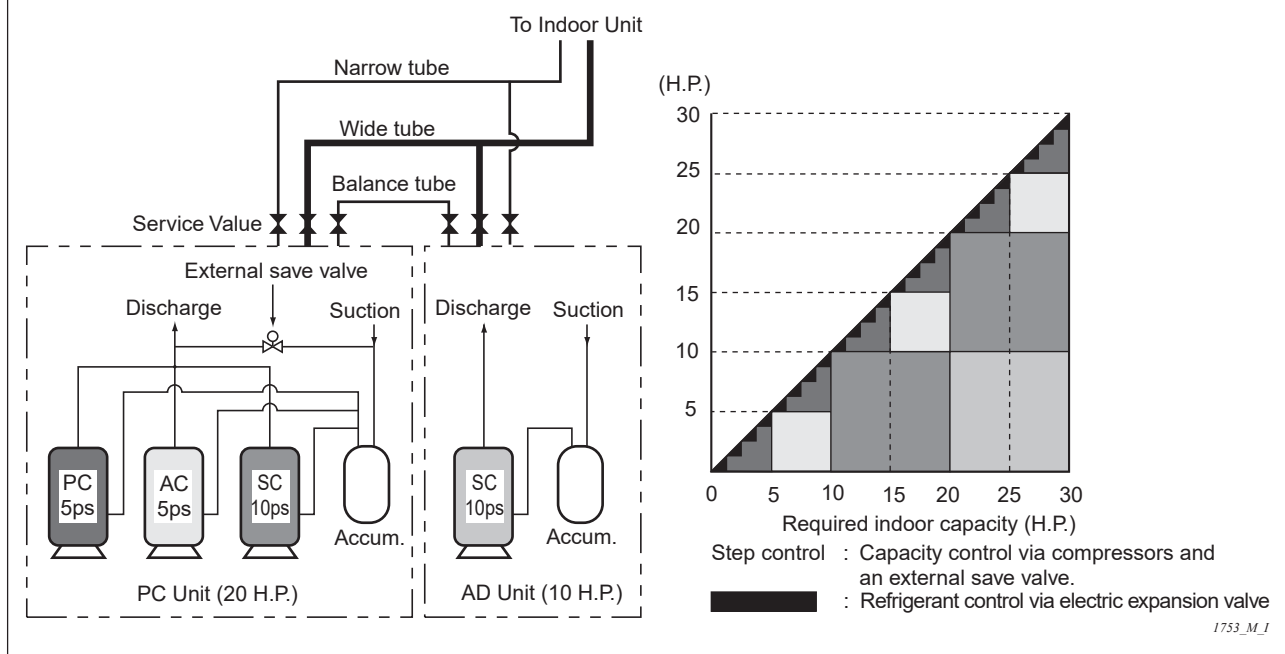

NOTE

* When two outdoor units are used for one refrigerant circuit, be sure to use one PC unit and one AD unit, each.

2. Features of W-ECO MULTI SYSTEM

Capacity control

With a triple compressor organization (consisting of one PC compressor and two AC compressors), capacity control can be implemented by adding an external save valve.

Complying EMC standard

Instead of an inverter, the W-ECO MULTI system uses a power control compressor and an external save valve to control capacity. This results in reduced harmonic wave emissions.

With the new power control compressor, now you can control output in 2.8 kW (1 HP) increments without inverter technology.

- Three-compressor structure features a power control compressor (PC comp.) and two standard constant speed compressors. The combination of these compressors and an external save valve makes it possible to realize compressor capacity control of 16 steps.

In addition, an electronic expansion valve on the indoor unit realizes even more precise control of refrigerant flow volume for better capacity control in accordance with load.

1767_M_1

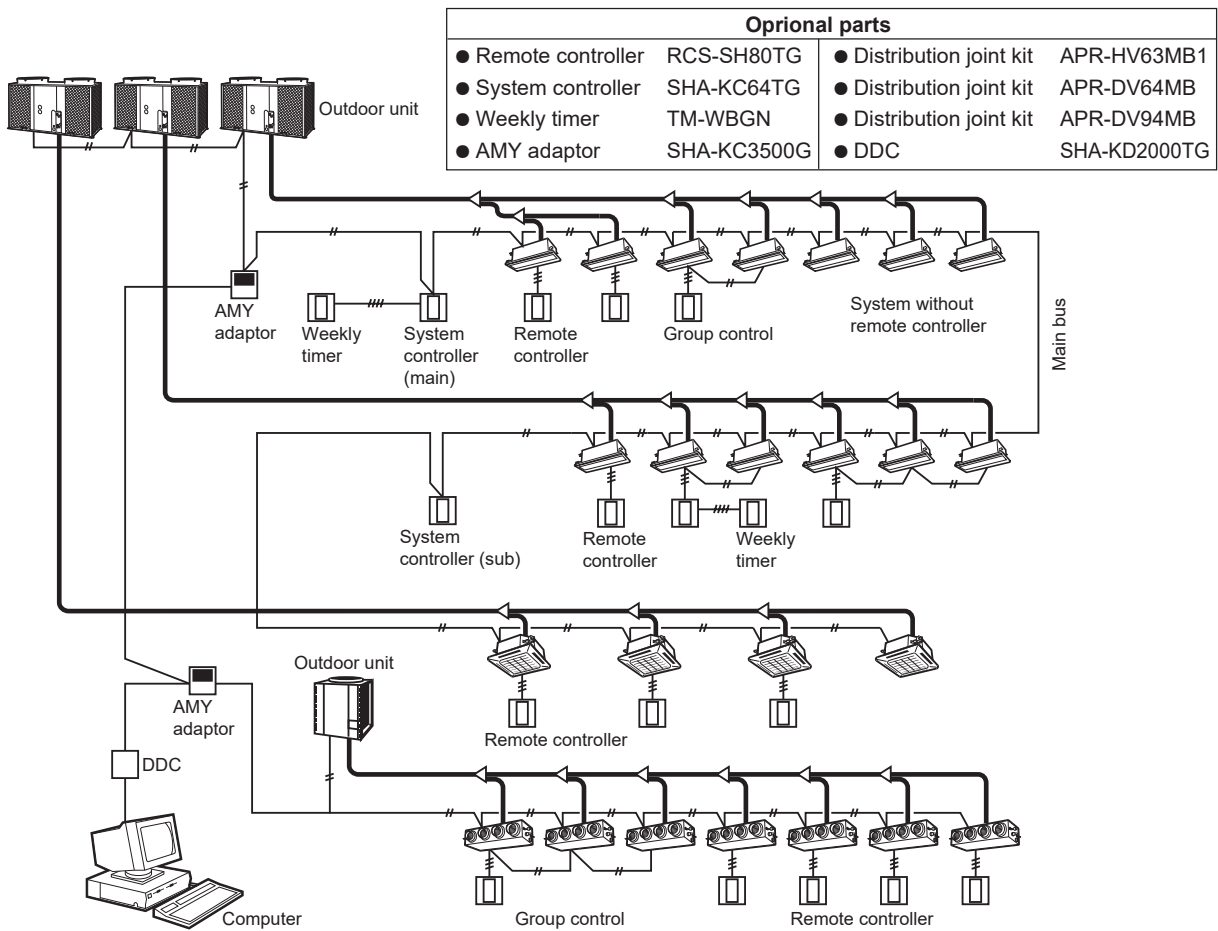

2. Features of W-ECO MULTI SYSTEM

■ Control system diagram

The indoor and outdoor units each have communications terminals that allow connection of as many as 94 units (Indoor unit : Max. 64+Outdoor unit : Max.30) to a single communications line (non-polar twin-line main bus).

- The main bus is twin-core and non-polar for easier wiring.
- Indoor unit settings are automated for easy installation.

Note A "bus" is a pathway for transmitting control signals.

1755_K_1

1

2. Features of W-ECO MULTI SYSTEM

2-2. Installation

■ Compact size and Light weight outdoor unit

		150 Type	190 Type	70 Type	90 Type
Dimensions: H × W × D mm		1,318 × 2,050 × 883		1,318 × 883 × 883	
Net weight	Heat pump	498 kg	512 kg	246 kg	250 kg

■ No Address switch

ECO series eliminate address switches in the indoor unit. So installers are free from troublesome setting work of address switch.

Manual setting with remote controller is also possible.

■ Simple wiring

ECO series adopt innovative 2-wire signal transmission link system (S-Net).

The control lines of inter-units are connected without reference to polarity.

Even more this system employs the Automatic Check Function for connection errors of inter unit wiring and piping.

■ Distribution joint kit (option)

Distribution joint kit (optional) reduces the amount of work involved in installation and increases the reliability of the system.

Optional distribution joint kit

2-3. Control characteristics

■ New control wiring system (S-net link system)

- It allows connection of as many as total of 94 units ($64 \geq$ Indoor unit + $30 \geq$ Outdoor unit) in a network with a single control line (non-polar twin-wire main bus).
- The main bus is twin-wire and non-polar for easier wiring.

NOTE

A "bus" is a pathway for transmitting control signals.

■ Remote controller

- "Remote Controller" (option) with built in easy-to-see & easy-to-use large LCD
- System control functions come as standard
- Maximum up to 8 indoor units can be concurrently controlled with a remote controller. (Group control)
- One more remote controller can be installed at different place. Operation from another desired one becomes possible.

■ System controller

- By using the System Controller (option) together with remote controllers, central control of maximum 64 indoor units becomes possible individually.

System Controller & Remote Controllers used concurrently

■ Weekly timer

- A program covering 1 week for timer operation 3 times a day can be set, using the Weekly Timer (option). Weekly Timer can be connected with both Remote Controller and System Controller.

2. Features of W-ECO MULTI SYSTEM

2-4. Delicate control with large crystal display

■ Remote controller (RCS-SH80TG)

: Option

575_8132

■ Operating state appears on a large crystal display

■ Automatic fan speed control

The fan speed is automatically switched over (Hi - Me - Lo) according to the difference in the room temperature and set temperature. Similarly while heating, the fan speed is changed (Hi - Me - Lo) so as not to lower the hot blast temperature.

■ ON / OFF Timer

ON / OFF timer can be set to 0.5 hour gradations. (Max. 72 hours)

■ Automatic restart function after power failure

Even when power failure occurs, preset programmed operation can be reactivated once power is resumed.

■ Filter sign

Filter sign informs you the time of maintenance.

2500 hrs: X, T, S, SL type
150 hrs: AS, K, F, FM type

■ "Personal" comfortable air flow

● Comfortable auto flap control

- The flap is automatically positioned moving it upward / downward, at the time of switching over between cooling, and heating.
- The flap can be set at desired position with the fan aim setting button (heating, fan : 5 steps; cooling : 3 steps).
- Flap position is kept memorized (at the time of manual setting).

■ Group control of up to 8 units

● Up to 8 indoor units controlled with a remote controller

The remote controller is suitable for air-conditioning a large room with multiple air-conditioners.

- * Flap setting is also done concurrently.

576_8132

● Control with main / sub remote controllers

Maximum up to 2 remote controllers (1 main remote controller + 1 sub remote controller) can be installed per unit.

577_8132

- * Timer setting cannot be done with sub remote controller.
- * Connect the remote controllers to the main unit.

■ Service check

The alarms generated in the past are kept memorized, and can be checked on the LCD. This simplifies diagnosis, and the servicing work is drastically alleviated.

3. Outline of Indoor Unit

3-1. 4-Way air discharge semi-concealed type

XR123GH, XR183GH, XR253GH,
XR363GH, XR483GH
X123GH, X183GH, X253GH,
X363GH, X483GH

The 4-way air flow makes it comfortable right up to every corner. Excelling in quietness and needing no special installation space, it suits all the requirements of office, stores, etc.

12, 18, 25 Type

578_8132

■ Drain pump is adapted

Drain-up pump is built in to the unit to raise the drain pipe from the ceiling to 50 cm high.

■ Long-life filter

Long-life maintenance-free filter good for approximately 2,500 hours, is standard equipment.

Even more, filter sign of remote controller indicates the time of maintenance.

Furthermore anti-mold treatment is done for Long-life filter, flap and drain-pan.

■ Light-weight unit and decorative panel

Type	12	18	25	36	48
Weight (kg)	29	29	30	38	38

■ Air-intake chamber (Option)

When used to take in fresh air, attach the air-intake chamber to the unit.

Air-intake chamber is optionally provided.

CMB-GSJ80T for 12, 18, 25 type

CMB-GSJ140T for 36, 48 type

* Air-intake box is supplied with air-intake chamber.

1270_X_1

Filter chamber incorporating a high-performance filter.

1271_X_1

■ Whisper-quiet operation

The noise level of Type 12, 18, 25 has reduced to 37 dB (A) in the "Hi" mode and 31 dB (A) in the "Lo" mode. Thanks to the newly developed turbo fan and decreased air path resistance, one of the trade's lowest levels of noise has been realized.

Noise values

Type	12, 18	25	36, 48
Hi / Me / Lo (dB-A)	37 / 35 / 30	37 / 35 / 31	43 / 40 / 36

Turbo Fan

782_8132

■ High performance filter (Option)

High performance filter 65%, 90% is available optionally.

	12, 18, 25 type	36, 48 type
* High performance filter 65%	AFT-MSJ80T	AFT-MSJ140T
* High performance filter 90%	AFT-HSJ80T	AFT-HSJ140T

NOTE

* If installing a high performance filter, a filter chamber (Option) is required.

CMB-GSJ80T for 12, 18, 25 type

CMB-GSJ140T for 36, 48 type

3. Outline of Indoor Unit

3-2. 2-Way air discharge semi-concealed type

SR93GH, SR123GH, SR183GH, SR253GH
S93GH, S123GH, S183GH, S253GH

579_8132

■ Ideal air stream realized for both heating and cooling.

Comes with auto flap feature as standard.

When the fan speed becomes Lo at the time of heating, the auto flap adjusts the area of blow port and retains the fan speed at the same level as at the time of Hi, keeping the whole room warm. What's more, it comes with an auto swing feature which further widens the air stream, automatically setting the flap at ideal angle at the time of both heating and cooling.

783_8132

■ New design creating a high grade sense

The exposed portion of ceiling panel designed to be a slim 5 mm thick.

■ Long life filter comes as standard

Same specification as 4-way air discharge semiconcealed type.

■ Build-in drain pump

■ Whisper-quiet operation

3. Outline of Indoor Unit

3-4. Wall-mounted type

KR93GH, KR123GH, KR183GH
K93GH, K123GH, K183GH

- **Sophisticated Color and Round Surface Design**
- **Simple installation work**
- **3-way tubing possible**

- **Air sweep function**

The air sweep function moves the flap up and down in the air outlet, directing air in a "sweeping" motion around the room and providing comfort in every corner.

IMPORTANT

When indoor units are installed in a calm place where low noise is required such as hotel rooms, bed rooms or VIP rooms and so on, noise from Electronic Expansion Valve controlling refrigerant flow may be offensive to the ear during cooling and heating operation. In order to prevent the noise, please install optional External Electronic Expansion Valve Kit (ATK-SVK80TG/SVK140TG) at narrow tube 5 to 15 m away from indoor unit.

3-5. Ceiling-mounted type

TR183GH, TR253GH, TR363GH, TR483GH

- **Ideal air flow realized for both heating and cooling. Auto flap feature comes as standard.**

The air flow direction is automatically set for both cooling and heating. While heating with Lo speed, the blowout angle is directed downward so as to warm up the feet. The blowout angle is adjusted in 5 stages from 4 degrees upward to 80 degrees downward. In addition, there is the auto swing feature to further widen the air stream.

- **Whisper-quiet operation**

Noise values

Type	18	25	36	48

- Fresh air intake $\varnothing 150$ is provided.

● Built-in drain pump

One of the major features of the new concealed-duct type air-conditioner is that air flow outlets can be arranged individually using circular flexible ducts. This more efficient air flow creates a more balanced air conditioning. Moreover, since the indoor unit is installed behind the ceiling, the new concealed-duct model saves space. As you see, it will adapt to any rectangular or L-shaped room, for example, simply by arranging the air outlets. The flexible outlets do not interfere with the room lighting, but square ducts may be substituted for flexible ones, of course. There is also an inlet for bringing in fresh air from outdoors.

a) Rectangular Room

586_8132

b) L-Shape's Room

587_8132

c) Large Room

588_8132

3-7. Concealed-duct high static pressure type

DR253GH, DR363GH, DR483GH
D253GH, D363GH, D483GH

738_8132

DR763GH, DR963GH

1756_D_1

- High static pressure type suitable to a real duct design

- Realized the high static pressure with the external static pressure of more than 147 Pa (15 mm Aq)

Enables a more highly-advanced design to conform to the interior of the room, because the shape of the air flow outlet such breeze line is freely selected.

- The external static pressure of more than 176 Pa (18 mm Aq) : 76 Type, 216 Pa (22 mm Aq) : 96 Type.

3. Outline of Indoor Units

3-8. Floor-standing type (F Type)

FR93GH, FR123GH
FR183GH, FR253GH
F93GH, F123GH
F183GH, F253GH

0865_F_1

3-9. Concealed floor-standing type (FM Type)

FMR93GH, FMR123GH
FMR183GH, FMR253GH
FM93GH, FM123GH
FM183GH, FM253GH

0866_FM_1

Flat appearance and easy to maintain.

- Front panel opens fully for easier maintenance.
- Removable air discharge grille allows changing air flow direction.
- Pipes installable from either side of the indoor unit (left or right).

1275_X_1

A slim design with depth just 229 mm allows easy installation in various locations such as perimeter zones.

- Front panel opens for easier maintenance from the front.
- Pipes can be installed from either side of the indoor unit (Left or right).

1276_X_1

IMPORTANT

When indoor units are installed in a calm place where low noise is required such as hotel rooms, bed rooms or VIP rooms and so on, noise from Electronic Expansion Valve controlling refrigerant flow may be offensive to the ear during cooling and heating operation. In order to prevent the noise, please install optional External Electronic Expansion Valve Kit (ATK-SVK80TG/SVK140TG) at narrow tube 5 to 15 m away from indoor unit.

3. Outline of Indoor Units

3-10. 1-Way air discharge semi-cessed slim type

SLR93GH, SLR123GH
SLR183GH, SLR253GH

Super-slim 19.8 cm design

- With an embedded area of just 19.8 cm, it is ideal for installation in areas with limited space. Plus, the ceiling panel is just 1.5 cm deep, so it doesn't impose on the interior design of the room.

Auto-flap system and long-life filter

- The ceiling panel features an auto-flap system that automatically sets the perfect flap angle to match the cooling or heating operation. And with the long-life filter, you don't need to worry about maintenance for the first 2,500 hours.
- Built-in high performance drain pump.

Installation

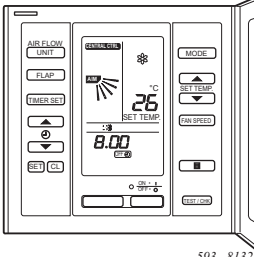

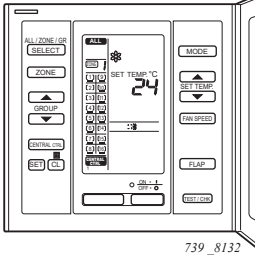

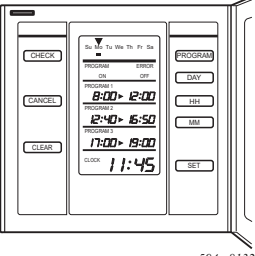

● Easy Installation and Maintenance

Unit position can be adjusted by simply detaching the side covers of the ceiling panel, so there's no need to dismantle the entire panel.

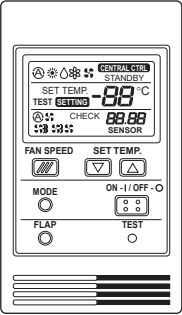

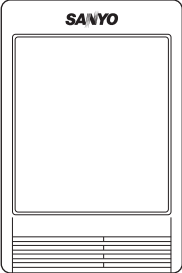

4. Example of W-ECO MULTI SYSTEM

4-1. List of controllers

Name	Features	Ref. page
<p>Remote Controller RCS-SH80TG</p>  <p>593_8132</p>	<ul style="list-style-type: none"> ① Group (collective) control of maximum up to 8 indoor units with a remote controller is possible. ② Control with multiple remote controls (main / sub) is possible. (Max. 2) ③ Operating state appears on a large crystal display, and service check functions are also provided. ④ Comes with 72-hour ON / OFF timer. 	III-6~
<p>System Controller SHA-KC64TG</p>  <p>739_8132</p>	<ul style="list-style-type: none"> ① Used in combination with remote controllers, the system controller can control up to 64 groups of indoor units. (Max. 64 indoor units). ② Separating the 64 indoor units into 4 zones, each zone can be controlled individually. ③ Maximum up to 16 groups (indoor units) can be registered to each zone. ④ Collective control and individual group (unit) control can be performed also. ⑤ Remote controllerless system is also possible. ⑥ Up to 2 system controllers (1 main , 1 sub) can be installed in a system. ⑦ Alarm and operation output for an external collected signal is available (potential free contact). ⑧ Power supply: AC 220 - 240 V. 	III-31~
<p>Weekly Timer TM-WBGN</p>  <p>594_8132</p>	<ul style="list-style-type: none"> ① Program covering a week, in which the operation can be stopped 3 times per day, can be set. * In case of power failure, the timer stores recorded programs for up to 100 hours. ② Temporary cancellation with cancel button is also possible. ③ Can be used concurrently with standard remote controller, unit controller, and system controller. 	III-51~

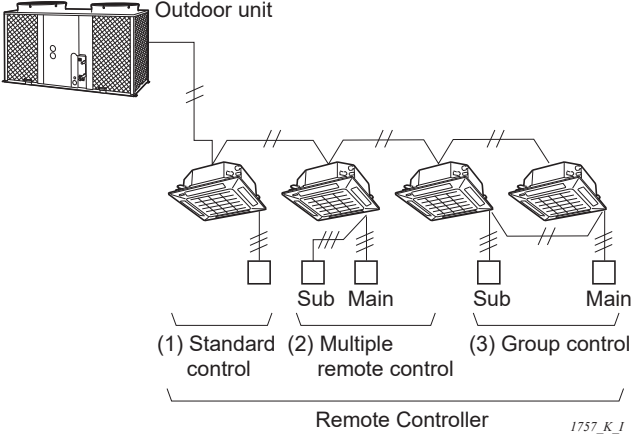

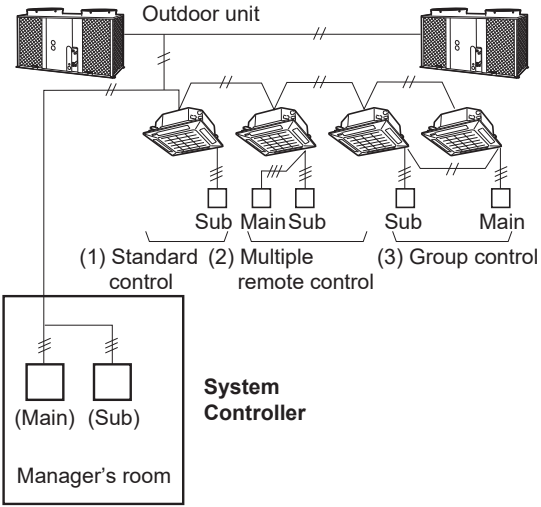

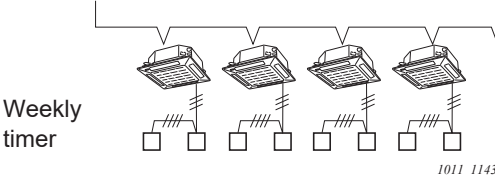

4. Example of W-ECO MULTI SYSTEM

Name	Features	Ref. page
<p>Simplified Remote Controller RCS-KR1T</p>  <p>1494_T_1</p>	<ol style="list-style-type: none"> ① This easy-to-operate, multifunction remote controller is ideal for use in hotels and large facilities not requiring precise temperature control. ② Basic functions include Start/Stop, Mode selection, Temperature and Fan Speed/Airflow settings. ③ Automatic Reset function for power failure ④ Group control of up to 8 indoor units with a remote controller is possible. ⑤ The RCS-KR1T can be mounted on or embedded flush with the wall. ⑥ The remote controller may also be installed flush with the surface of a night table. However, in the case the unit's built-in thermostat will not function. ⑦ This controller's also features an alarm, self-diagnosing, remote-controlled thermostat (for wall-mounted models), and main/ sub operation. ⑧ The RCS-KR1T cannot be connected with a Weekly Timer. 	III-62~
<p>Remote Sensor ART-K41T</p>  <p>1495_T_1</p>	<ol style="list-style-type: none"> ① A remote sensor applicable to air-conditioning units. ② This sensor can detect room temperatures without the use of a body sensor (Recommended for air-conditioning systems not equipped with remote control). 	III-68~
<p>AMY adaptor SHA-KC3500G D.D.C. SHA-KD2000TG</p>  <p>1783_M_1</p>	<ol style="list-style-type: none"> ① Used in combination with 32 × Amy adaptors, Direct Digital Controller can directly connect to BMS for up to Max. 2048 (64 × 32) indoor units and Max. 960 (30 × 32) outdoor units. ② The controller makes it possible to use a large-scale intelligent building control system. ③ Capable of handling input/output operation data for indoor units' central control, status monitoring, and electricity bill rate for each tenant. ④ When connecting with BMS, the user should make sure that computer software is in compliance with the communication protocol specification of DDC. 	III-70~

1. Model Selecting and Capacity Calculation

1-1. Operating range

2

Cooling

Heating

● : Rated conditions

Cooling operating range

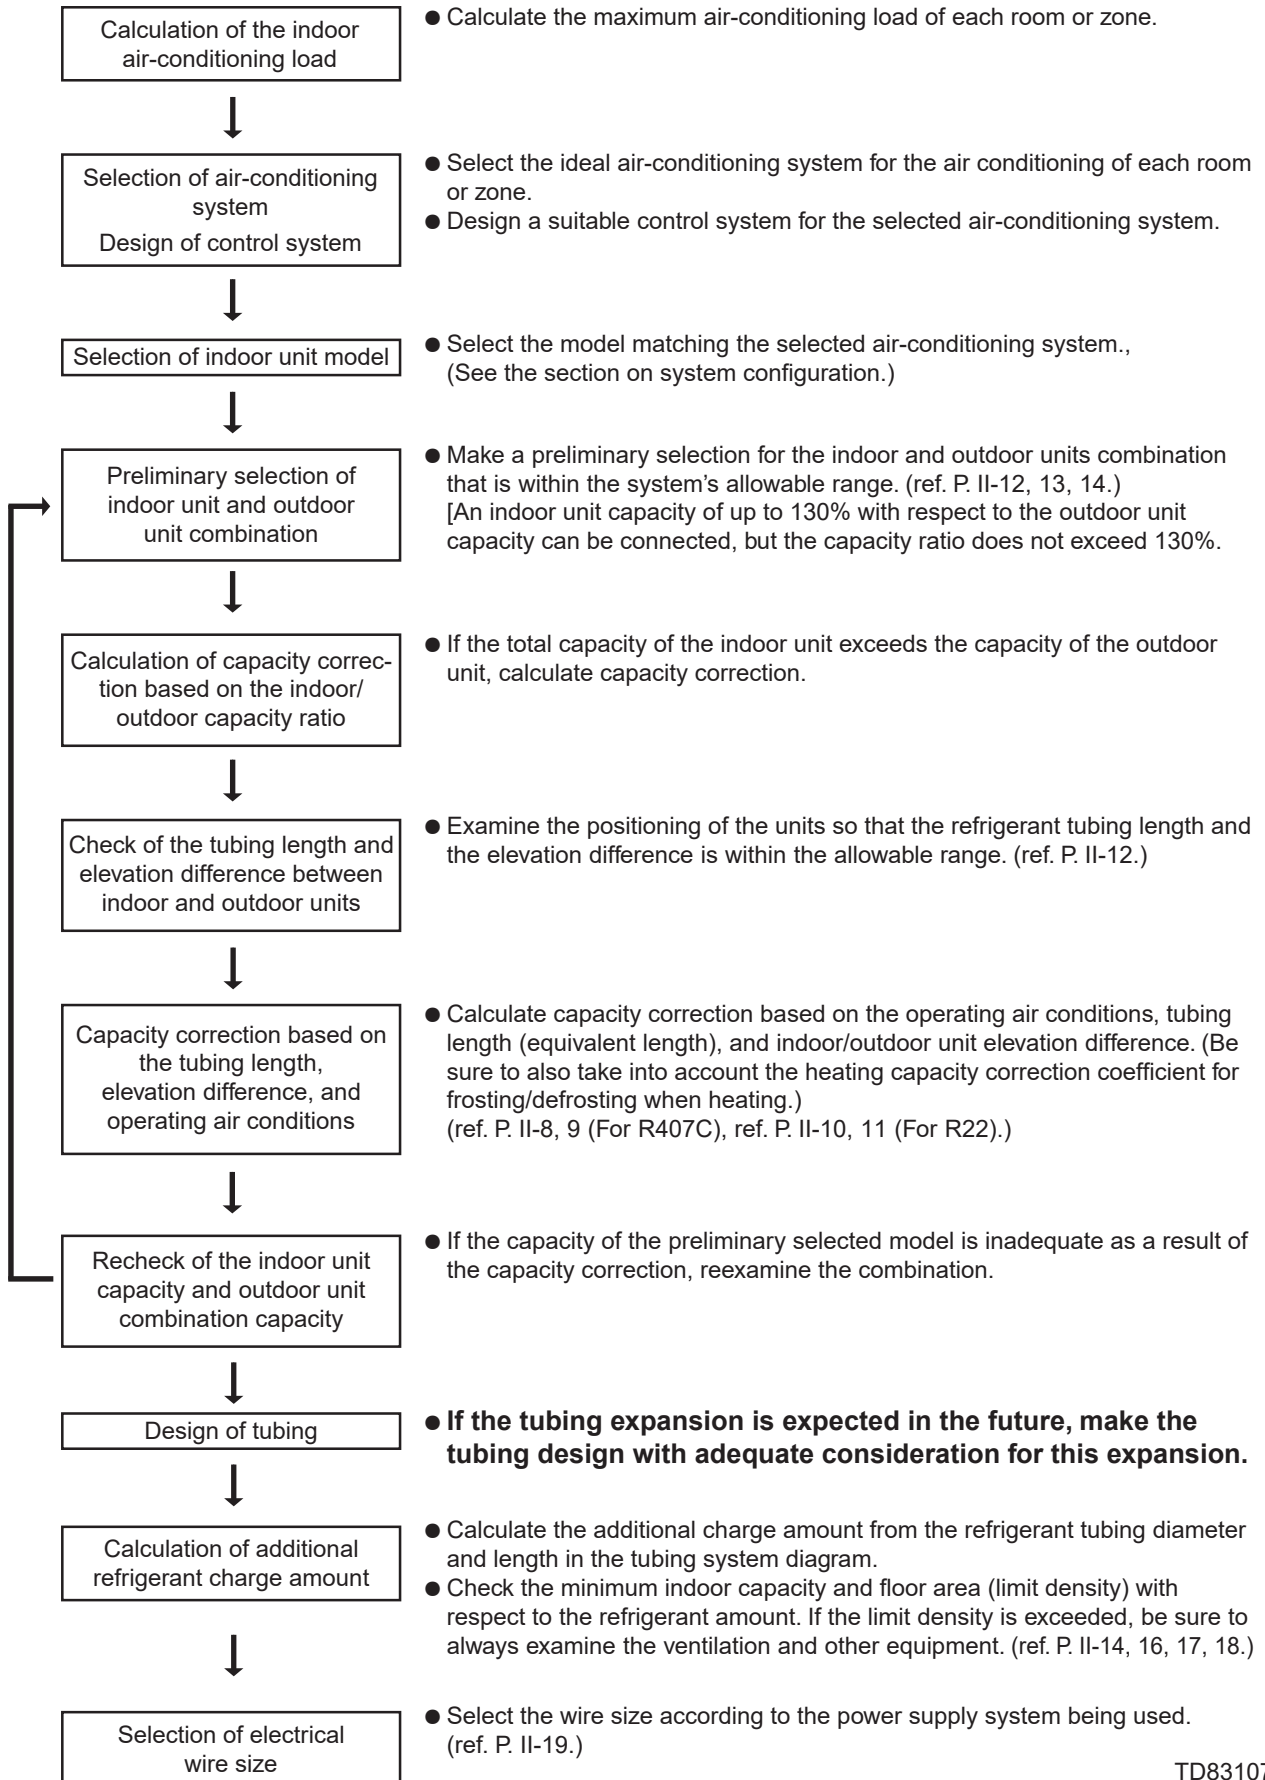

NOTE

When combined with the AD unit, outdoor air intake temp for operating range is between 5°C and 43°C.

1. Model Selecting and Capacity Calculation

1-2. Procedure for selecting models and calculating capacity

Select the model and calculate the capacity by using the procedure below.

1. Model Selecting and Capacity Calculation

1-3. Calculation of actual capacity

Since the capacity of multi air-conditioner changes according to the temperature conditions, tubing length, elevation difference, etc. select the right model taking into account various correction values.

- The actual capacity of multi air-conditioner according to its installation conditions is given by the following expression.

<Cooling capacity>

$$\text{Cooling capacity of indoor unit} = \frac{(\text{Indoor unit corrected capacity by indoor / outdoor capacity ratio}) \times \text{① (P. II-6)}}{\text{② (P. II-8 (For R407C), II-10 (For R22))}} \times$$

$$\frac{(\text{Capacity coefficient by indoor / outdoor temperature conditions}) \times \text{③ (P. II-9 (For R407C), II-11 (For R22))}}{\text{④ (P. II-8 (For R407C), II-10 (For R22))}}$$

$$\frac{(\text{Capacity coefficient by tubing length}) \times \text{③ (P. II-9 (For R407C), II-11 (For R22))}}{\text{④ (P. II-8 (For R407C), II-10 (For R22))}}$$

<Heating capacity>

$$\text{Heating capacity of indoor unit} = \frac{(\text{Indoor unit corrected capacity by indoor / outdoor capacity ratio}) \times \text{① (P. II-6)}}{\text{② (P. II-8 (For R407C), II-10 (For R22))}} \times$$

$$\frac{(\text{Capacity coefficient by indoor / outdoor temperature conditions}) \times \text{③ (P. II-9 (For R407C), II-11 (For R22))}}{\text{④ (P. II-8 (For R407C), II-10 (For R22))}}$$

$$\frac{(\text{Capacity coefficient by tubing length}) \times \text{③ (P. II-9 (For R407C), II-11 (For R22))}}{\text{④ (P. II-8 (For R407C), II-10 (For R22))}}$$

$$\frac{(\text{Capacity coefficient by frosting / defrosting}) \times \text{③ (P. II-9 (For R407C), II-11 (For R22))}}{\text{④ (P. II-8 (For R407C), II-10 (For R22))}}$$

* There is a respective characteristics chart on the page written below each correction item. Find out the respective correction values from various conditions.

- Capacity correction by indoor / outdoor capacity ratio of indoor unit : ①

The total capacity ratio of indoor unit as against the outdoor unit can be connected maximum up to 130 %.

If the usage time period changes, or in case of buildings where the generating time of maximum load changes, the capacity of outdoor unit can be reduced by selecting somewhat larger total capacity of the indoor units than that of the outdoor unit. Here, if the indoor/outdoor capacity ratio exceeds 100 %, the capacity of outdoor unit increases somewhat during concurrent operation, but the capacity of each indoor units decreases below the rated value.

The corrected capacity of indoor unit can be found out from the table of corrected capacities given on P. II-6, after calculating the indoor / outdoor capacity ratio with the following expression, separately for cooling and heating.

- Cooling :

$$\text{Indoor / Outdoor unit capacity ratio} = \frac{(\text{Total cooling capacity of indoor units})}{(\text{Rated capacity of outdoor unit})} \times 100$$

- Heating :

$$\text{Indoor / Outdoor unit capacity ratio} = \frac{(\text{Total heating capacity of indoor units})}{(\text{Rated capacity of outdoor unit})} \times 100$$

1. Model Selecting and Capacity Calculation

■ Outdoor unit capacity when the indoor / outdoor capacity ratio is in the range of 100 % to 130 %

The outdoor unit capacity, in case the indoor / outdoor capacity ratio is 100 % - 130 %, can be found out from the table of corrected capacities given the graph shown on the right.

Ex: When both the indoor / outdoor capacity ratios are 107 % as against the cooling capacity of 28.0 kW (95,500 BTU/h) and heating capacity of 31.5 kW (107,500 BTU/h) of the outdoor unit, the outdoor unit capacity is obtained from the graph on the right as follows.

- Corrected Cooling Capacity = 1.0175×28.0 (95,500)
 ≈ 28.49 kW (97,170 BTU/h)
- Corrected Heating Capacity = 1.0075×31.5 (107,500)
 ≈ 31.74 kW (108,310 BTU/h)

The corrected capacity of each indoor unit is found out from the ratio of the above given outdoor unit corrected capacity and the total capacity of indoor units.

$$\text{Corrected capacity of each indoor unit} = \text{Rated capacity} \times \frac{(\text{Outdoor unit corrected capacity})}{(\text{Total rated capacity of the indoor units of identical system})}$$

* The results of above calculation are given on the table on next page (table of corrected capacities). The corrected capacities of indoor and outdoor units can be found out from the calculation of indoor / outdoor capacity ratio only.

■ Capacity correction by the temperature conditions of indoor / outdoor unit: ②

The capacity correction value (capacity coefficient ②) according to the temperature conditions of indoor / outdoor unit can be found out from the graph given on P. II-8, II-10.

■ Capacity correction by tubing length and elevation difference: ③

The capacity correction value (capacity coefficient ③) according to the tubing length and elevation difference can be found out from the graph given on P. II-9, II-11.

■ Heating capacity correction coefficient at the time of frosting / defrosting: ④

The above value (capacity correction coefficient ④) can be found out from the table given on P. II-8, II-10.

1. Model Selecting and Capacity Calculation

- Corrected capacity of indoor unit when Indoor / Outdoor unit capacity ratio is in the range of 100 to 130 %

1. Model Selecting and Capacity Calculation

1-4. Capacity correction graph according to temperature condition (For R407C)

Rating value: Cooling

Model	Cooling capacity :kW (Btu/h)	Input: kW 380 - 400 - 415 V
70 type	22.4 (76,400)	9.46 - 9.52 - 9.58
90 type	28.0 (95,500)	11.3 - 11.4 - 11.5
150 type	45.0 (154,000)	17.6 - 17.7 - 17.8
190 type	56.0 (191,000)	21.9 - 22.1 - 22.3

Rating value: Heating

Model	Heating capacity :kW (Btu/h)	Input: kW 380 - 400 - 415 V
70 type	25.0 (85,300)	9.08 - 9.12 - 9.17
90 type	31.5 (107,500)	10.6 - 10.8 - 11.0
150 type	50.0 (171,000)	16.9 - 17.0 - 17.2
190 type	63.0 (215,000)	20.6 - 21.0 - 21.4

● Heating capacity correction coefficient at the time of frosting / defrosting (For R407C)

Outdoor suction air temp (CWB, RH85 %)	-11	-10	-9	-8	-7	-6	-5	-4	-3	-2	-1	0	1	2	3	4	5	6
Correction coefficient	0.97	0.97	0.97	0.96	0.95	0.94	0.91	0.89	0.88	0.87	0.87	0.87	0.88	0.89	0.91	0.92	0.95	1.0

- To find out the heating capacity taking into account the frosting / defrosting operation, multiply the capacity given in the capacity chart with the value in the above table.
- The correction coefficients are for outdoor capacity ratio 100 % heating operation.

System example	Cooling				Heating			
	Outdoor temp. (DB)	Indoor temp. (WB)	Capacity coefficient	Input coefficient	Outdoor temp. (WB)	Indoor temp. (DB)	Capacity coefficient	Input coefficient
Indoor unit 25: a	33 °C	19 °C	100 %	95 %	0 °C	20 °C	89 %	92 %
Indoor unit 12: b	33 °C	19 °C	100 %	95 %	0 °C	20 °C	89 %	92 %
Indoor unit 9: c	33 °C	17.5 °C	90 %	81 %	0 °C	22 °C	86 %	94 %
Indoor unit 18: d	33 °C	17.5 °C	90 %	81 %	0 °C	22 °C	86 %	94 %
Indoor unit 36: e	33 °C	17.5 °C	90 %	81 %	0 °C	22 °C	86 %	94 %

1. Model Selecting and Capacity Calculation

1-5. Capacity correction graph according to refrigerant tubing length and elevation difference (For R407C)

To minimize the reduction in cooling capacity to be caused when an excessively long tubing is used, we recommended increasing the diameter of the wide tubing as indicated in Table 1. Do not exceed the recommended total tubing length.

* Increase diameter of the gas tubing side only, as specified in Table 1. Calculate the refrigerant additional charging volume appropriate for the narrow tubing diameter and length.

Table 1: Equivalent coefficient of correction of tubing length to be applied when increasing the diameter of the gas tubing.

Reference tubing diameter (wide tubing) mm	ø12.7	ø15.88	ø19.05	ø22.22	ø25.4	ø28.58	ø31.75	ø38.1	ø41.28	ø44.45
Modified tubing diameter (wide tubing) mm	ø15.88	ø19.05	ø22.22	ø25.4	ø28.58	ø31.75	ø38.1	ø41.28	ø44.45	ø50.8
Equivalent coefficient of correction of tubing length	0.4		0.5			0.6		0.7		

When increasing the tubing diameter on the gas side, calculate the equivalent length by the coefficient of correction as specified in Table 1.

$$\text{Equivalent tubing length after increasing the diameter} = \text{Reference tubing length} \times \text{equivalent coefficient of correction of tubing length}$$

NOTE

- 1) Plus side of the elevation difference is when the outdoor unit is higher than the indoor unit.
- 2) Minus side of the elevation difference is when the outdoor unit is lower than the indoor unit.
- 3) The value of gas tube is used as equivalent length.
- 4) The capacity of each indoor unit is calculated by multiplying it with the capacity coefficient, as obtained from the total equivalent lengths of main tubes and distribution branches which are directly connected to the indoor units.
- 5) Equivalent length conversion is not necessary for the optional distribution joint.
- 6) Total equivalent length is calculated by adding the straight equivalent length of joints to the actual length.
- 7) Model selection is done from the value calculated for total cooling and total heating.

System example	Elevation difference	Total equivalent tubing length	Cooling capacity coefficient	Heating capacity coefficient
Indoor unit 25: a	30 m	54.2 m	90.0 %	97.4 %
Indoor unit 12: b	30 m	60.8 m	89.0 %	97.1 %
Indoor unit 9: c	30 m	70.9 m	87.0 %	96.5 %
Indoor unit 18: d	34 m	61.8 m	88.0 %	97.0 %
Indoor unit 36: e	34 m	65.8 m	88.0 %	96.8 %

- 6) Total equivalent length is calculated by adding the straight equivalent length of joints to the actual length.
- 7) Model selection is done from the value calculated for total cooling and total heating.

System example	Elevation difference	Total equivalent tubing length	Cooling capacity coefficient	Heating capacity coefficient
Indoor unit 25: a	30 m	54.2 m	85.7 %	93.9 %
Indoor unit 12: b	30 m	60.8 m	83.8 %	93.0 %
Indoor unit 9: c	30 m	70.9 m	80.9 %	91.8 %
Indoor unit 18: d	34 m	61.8 m	83.2 %	92.9 %
Indoor unit 36: e	34 m	65.8 m	82.1 %	92.4 %

1. Model Selecting and Capacity Calculation

1-8. Design of tubing length

1627_M_1

Items	Marks	Contents	Length (m)
Allowable tubing length	L1	Max. tubing length	Actual length ≤ 100 Equivalent length ≤ 125
		$\Delta L = (L2 - L4)$	Difference between max. length and min. length from the No.1 distribution joint ≤ 40
	LM	Max. length of main tubing (which has max. diameter) ≤ 50	
	$l_1, l_2 \sim l_{32}$	Max. length of each distribution tube ≤ 30	
	$L1 + l_1 + l_2 + \sim l_{31}$ $l_A + l_B + LF + LG + LH$	Total max. tubing length including length of each distribution tube (only narrow tube) ≤ 150	
Allowable elevation difference	H1	When outdoor unit is installed higher than indoor unit ≤ 50	
		When outdoor unit is installed lower than indoor unit ≤ 40	
	H2	Max. difference between indoor units ≤ 15	
	H3	Max. difference between outdoor units ≤ 4	
Allowable length of header tube	L3	Max. tubing length between the first T-joint and terminated (weld shut) end point ≤ 2	

L = Length, H = Height

2

1. Model Selecting and Capacity Calculation

Tubing size

Main tubing size (LA, LB, LC...)

Unit: mm (in.)

Combination Capacity of Outdoor Unit		40.0 kW or more less than 52.4 kW	52.4 kW or more less than 70.0 kW	70.0 kW or more less than 106.0 kW
Main tube size LA	Gas tube	ø38.10 (1 1/2)	ø41.28 (1 5/8)	ø44.45 (1 3/4)
	Liquid tube	ø15.88 (5/8)	ø19.05 (3/4)	ø22.22 (7/8)
Main tube size after distribution (LC...)	70 kW or more, less than 106.0 kW	Gas tube	–	ø44.45 (1 3/4)
		Liquid tube	–	ø22.22 (7/8)
52.4 kW or more, less than 70.0 kW	Gas tube	–	ø41.28 (1 5/8)	
	Liquid tube	–	ø19.05 (3/4)	
42.0 kW or more, less than 52.4 kW	Gas tube	ø38.10 (1 1/2)		
	Liquid tube	ø15.88 (5/8)		
30.0 kW or more, less than 42.0 kW	Gas tube	ø31.80 (1 1/4)		
	Liquid tube	ø15.88 (5/8)		
16.0 kW or more, less than 30.0 kW	Gas tube	ø28.58 (1 1/8)		
	Liquid tube	ø12.70 (1/4)		
9.0 kW or more, less than 16.0 kW	Gas tube	ø19.05 (3/4)		
	Liquid tube	ø9.52 (3/8)		
Below 9.0 kW	Gas tube	ø15.88 (5/8)		
	Liquid tube	ø9.52 (3/8)		

NOTE

- * In case that the total capacity of connected indoor unit exceeds the total capacity of outdoor unit, select the main tubing size for the total capacity of outdoor unit.
- * If the tubing expansion is expected in the future, make the tubing design with adequate consideration for this expansion.

Outdoor unit tubing size (l_A, l_B)

Unit: mm (in.)

	Power Control (PC) unit		Additional (AD) unit	
	150 type	190 type	70 type	90 type
Wide tube	38.1 (1 1/2)	41.28 (1 5/8)	25.4 (1)	28.58 (1 1/8)
	Brazing connection			
Narrow tube	15.88 (5/8)	19.05 (3/4)	12.7 (1/2)	
	Brazing connection		Flare connection	
Balance tube	9.52 (3/8)			
	Flare connection			

Distribution branch size (l₁, l₂...l₃₂)

Unit: mm (in.)

Indoor unit type	9 type	12 type	18 type	25 type	36 type	48 type
Wide tube	12.7 (1/2)		15.88 (5/8)		19.05 (3/4)	
Narrow tube	9.52 (3/8)*					

NOTE

- * For the 25 type, use the “Tube connector” (supplied with the unit) for sizing up a narrow tube from 6.35 to 9.52.

1. Model Selecting and Capacity Calculation

■ Straight equivalent length of joints

Design the tubing system by referring to the following table for the straight equivalent length of joints.

Straight Equivalent Length of Joints

Unit: m

Wide tube size (mm)		12.7	15.88	19.05	22.22	25.4	28.58	31.8	38.1	41.28	44.45
90° Elbow		0.30	0.35	0.42	0.48	0.52	0.57	0.70	0.79	0.85	0.92
45° Elbow		0.23	0.26	0.32	0.36	0.39	0.43	0.53	0.59	0.64	0.69
U-shape tube bent (R60~100 mm)		0.90	1.05	1.26	1.44	1.56	1.71	2.10	2.37	2.55	2.76
Trap bent		2.30	2.80	3.20	3.80	4.30	4.70	5.00	5.80	6.80	7.40
Y-branch distribution joint		Equivalent length conversion not needed									
Ball valve for service		Equivalent length conversion not needed									

Required copper tube dimensions

Unit: mm

Type		0						
Copper tube	Outer diameter	6.35	9.52	12.7	15.88	19.05	22.2	
	Wall thickness	0.8	0.8	0.8	1.0	1.0	1.2	

Type		1/2 H, H						
Copper tube	Outer diameter	25.4	28.58	31.8	38.1	41.3	44.45	50.8
	Wall thickness	1.0	1.0	1.2	1.3	1.3	1.4	1.5

NOTE

* Refrigerant pipes of the same wall thickness as R22 can be used for R407C.

* C1220 type with JIS H 3300 designation (Copper Pipe and Copper Alloy Seamless Pipe)

■ Additional refrigerant charge amount

Additional refrigerant charge amount is calculated from the narrow tube total length as follows.

Amount of refrigerant additional charge per meter, according to narrow tube size

Narrow tube size	Amount of refrigerant additional charge/m (g/m)
9.52	75
12.7	125
15.88	195
19.05	280
22.22	400
25.4	500

Required amount of additional charge
 = (Amount of additional refrigerant charge per meter of
 each size of narrow tube × its tube length)
 + (...) + (...)

* Always recharge accurately using a scale for weighing.

Refrigerant charge amount at shipment.

R407C models

R407C (kg)	PC unit		AD unit	
		SPW-CR1503GDYH8	SPW-CR1903GDYH8	SPW-CR703GDCH8

1. Model Selecting and Capacity Calculation

■ Recommended location of ball valves

- Recommend that install a ball valve kit at each outdoor unit
- Select the position to perform the service easily each unit or each refrigerant system

(1) In case of adding the indoor unit

① LOCATION: Install the ball valve at distribution tube (not main tube).

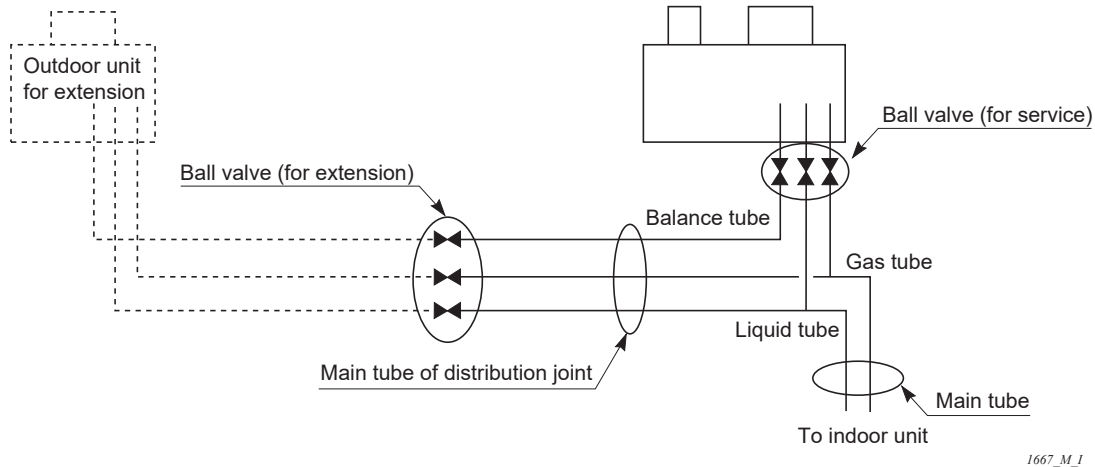

② Installation standard:

- Make sure to install the ball valve up grade to avoid the flow of oil.
- Install the ball valve at the shortest distance (within 40 cm) from the main tube.
In the event that the diameter of the ball valve is smaller than the one of the main tube, reduce the size of the area where it is installed by Reducer etc.
- Select the place where is easy to operate and consider that the establishment place is to be confirmed later.

(2) In case of adding the outdoor unit

① LOCATION: Install the ball valve at main tube of distribution joint.

② Installation standard:

- Make sure to install the ball valve up grade to avoid the flow of oil.
- Install the ball valve at the shortest distance (within 40 cm) from the main tube.
In the event that the diameter of the ball valve is smaller than the one of the main tube, use a Reducer etc., to reduce the size of the area where it is connected.

NOTE

* In the event that the ball valve is installed to the outdoor unit (including extension for outdoor unit), face the service port of the valve to the outdoor unit side (above illustration; dotted line) and have a distance over 50 cm from the outdoor unit. In case that the ball valve is installed between indoor unit (Including extension for indoor unit) and the main tube, face it to the indoor unit side (above illustration; dotted line).

1. Model Selecting and Capacity Calculation

WARNING

Always check the gas density for the room in which the unit is installed.

■ Check of limit density

When installing an air-conditioner in a room, it is necessary to ensure that even if the refrigerant gas accidentally leaks outside, its density does not exceed the limit level. If the density might exceed the limit level, it is necessary to set up an opening between it and the adjacent room, or to install a mechanical ventilation which is interlocked with the leak detector.

$$\frac{\text{(Total refrigerant charged amount : kg)}}{\left(\begin{array}{l} \text{Min indoor volume where the} \\ \text{indoor unit is installed : m}^3 \end{array} \right)} \leq \text{Limit density 0.3 (kg/m}^3\text{)}$$

The limit density of refrigerant which is used in this unit is 0.3 kg/m³ (ISO 5149).

The shipped outdoor unit comes charged with the amount of refrigerant fixed for each type; so add it to the amount that is charged at the field.

(For the refrigerant charge amount at shipment, please refer to the unit's nameplate.)

■ Installing distribution joint

- (1) Refer to "HOW TO ATTACH DISTRIBUTION JOINT" enclosed with the optional distribution joint kit (APR-DV64MB, APR-HV63MB1 etc.).
- (2) ● The T-joint (not provided) installation direction should be either horizontal or vertical. The direction of the connection port to each indoor must be slanted slightly upward (15° to 30°) when the main tube is horizontal and can be any direction but the branch tube must be slightly upward when the tube is vertical (L3 shows tubing connected by a T-joint (1 meter or less)).
 - Make sure that the end point is solidly welded shut. Also pay attention to the insertion distance of each connection tube so refrigerant flow inside the T-joint is not blocked.
 - Never diverge a branch tube again after the T-joint (that is, there can only be 1 branch in a line).
- (3) The branch tube must have a trap when the branch tube after distribution is connected to only 1 indoor unit. If not, in case the indoor unit is defective, do not operate the system until the defective unit is repaired. Otherwise the compressor may develop problems because the refrigerant oil accumulates in the branch tube.

Minimum indoor volume & floor area as against the amount of refrigerant is roughly as given in the following table.

WARNING

Don't install the indoor unit to the place, such as a basement, etc. where refrigerant can stay, since refrigerant is heavier than air.

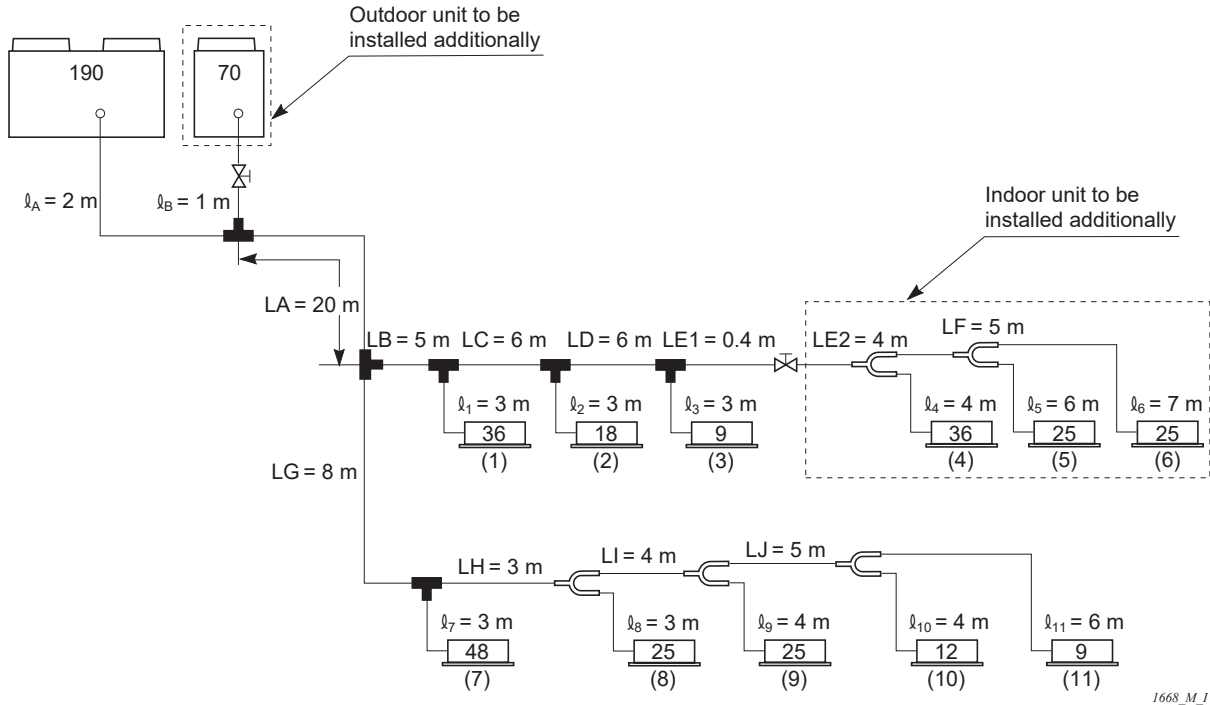

When in horizontal use

When in vertical use

2. Example of System Design

2-1. Example of tubing size selection and additional charge amount

		Rating Capacity	
		Cooling	Heating
Indoor unit	9 type: (3), (11)	2.8	3.2
	12 type: (10)	3.6	4.2
	18 type: (2)	5.6	6.3
	25 type: (5), (6), (8), (9)	7.3	8.0
	36 type: (1), (4)	10.6	11.4
	48 type: (7)	14.0	16.0
Outdoor unit	190 type	56.0	63.0
	70 type	22.4	25.0

Before extension

		Total cooling capacity after distribution joint / Outdoor unit type / Indoor unit type	Wide tube	Narrow tube	① Tubing length (m)	② Additional refrigerant (g/m)	①×②
							(g)
Main tube	LA	56 + 22.4 = 78.4 kW*	44.45 (1 3/4)	22.22 (7/8)	20	400 (m)	8000
	LB	10.6 + 5.6 + 2.8 + 10.6 + 7.3 + 7.3 = 44.2 kW	38.10 (1 1/2)	15.88 (5/8)	5	195	975
	LC	5.6 + 2.8 + 10.6 + 7.3 + 7.3 = 33.6 kW	31.80 (1 1/4)	15.88 (5/8)	6	195	1170
	LD	2.8 + 10.6 + 7.3 + 7.3 = 28.0 kW	28.58 (1 1/8)	12.70 (1/2)	6	125	750
	LE1	10.6 + 7.3 + 7.3 = 25.2 kW	28.58 (1 1/8)	12.70 (1/2)	0.4	125	50
	LG	14.0 + 7.3 + 7.3 + 3.6 + 2.8 = 35.0 kW	31.80 (1 1/4)	15.88 (5/8)	8	195	1560
	LH	7.3 + 7.3 + 3.6 + 2.8 = 21.0 kW	28.58 (1 1/8)	12.70 (1/2)	3	125	375
	LI	7.3 + 3.6 + 2.8 = 13.7 kW	19.05 (3/4)	9.52 (3/8)	4	75	300
Outdoor unit tube	IA 190 type		41.28 (1 5/8)	19.05 (3/4)	2	280	560
	IB 70 type		25.40 (1)	12.70 (1/2)	1	125	125
Distribution branch	I1 36 type		19.05 (3/4)	9.52 (3/8)	3	75	225
	I2 18 type		15.88 (5/8)	9.52 (3/8)	3	75	225
	I3 9 type		12.70 (1/2)	9.52 (3/8)	3	75	225
	I4 36 type		19.05 (3/4)	9.52 (3/8)	4	75	300
	I5 25 type		15.88 (5/8)	9.52 (3/8)	6	75	450
	I6 25 type		15.88 (5/8)	9.52 (3/8)	7	75	525
	I7 48 type		19.05 (3/4)	9.52 (3/8)	3	75	225
	I8 25 type		15.88 (5/8)	9.52 (3/8)	3	75	225
	I9 25 type		15.88 (5/8)	9.52 (3/8)	4	75	300
	I10 12 type		12.70 (1/2)	9.52 (3/8)	4	75	300
	I11 9 type		12.70 (1/2)	9.52 (3/8)	6	75	450

Total additional refrigerant charge amount before extension = 17,690 g

1668_M.1

2. Example of System Design

After extending indoor and outdoor unit

		Total cooling capacity after distribution joint / Outdoor unit type / Indoor unit type	Wide tube	Narrow tube	① Tubing length (m)	② Additional refrigerant (g/m)	①×② (g)
Main tube	LE2	10.6 + 7.3 + 7.3 = 25.2 kW	28.58 (1 1/8)	12.70 (1/2)	4	125	500
	LF	7.3 + 7.3 = 14.6 kW	19.05 (3/4)	9.52 (3/8)	5	75	375
Distribtuon branch	14	36 type	19.05 (3/4)	9.52 (3/8)	4	75	300
	15	25 type	15.88 (5/8)	9.52 (3/8)	6	75	450
	16	25 type	15.88 (5/8)	9.52 (3/8)	7	75	525

Additional refrigerant charge amount for extension = 2,150 g

Total refrigerant charge amount including initial charge amount
 = 20,000 g (190 type) + 8,000 g (70 type) + 17,690g + 2,150 g = 47,640 g

■ Checking of limit density

Density limit is determined on the basis of the size of a room using an indoor unit of minimum capacity.

For, instance, when an indoor unit (3) is used in a room (Floor area 15 m² × Ceiling height 2.7 m = Room volume 40.5 m³), the graph on the right shows that the minimum room volume should be 159 m³ (Floor area 59 m²) for refrigerant of 47.64 kg, and accordingly openings like louvers are required for the room.

<Determination by calculation>

$$\frac{\left(\begin{array}{c} \text{Overall refrigerant charge amount for} \\ \text{the air-conditioner : kg} \end{array} \right)}{\left(\begin{array}{c} \text{Minimum room volume for an indoor unit : m}^3 \end{array} \right)} \\
 = \frac{47.64 \text{ (kg)}}{40.5 \text{ (m}^3\text{)}} = 1.18 \text{ (kg/m}^3\text{)} \geq 0.3 \text{ (kg/m}^3\text{)}$$

Therefore, openings like louvers are required for the room.

1669_M_1

3. Electrical Wiring

3-1. General precautions on wiring

- (1) Before wiring, confirm the rated voltage of the unit as shown on its nameplate, then carry out the wiring closely following the wiring diagram.
- (2) Provide a power outlet to be used exclusively for each unit, and a power supply disconnect and circuit breaker for overcurrent protection should be provided in the exclusive line.
- (3) To prevent possible hazards from insulation failure, the unit must be grounded.
- (4) Each wiring connection must be done in accordance with the wiring system diagram. Wrong wiring may cause the unit to misoperate or become damaged.
- (5) Do not allow wiring to touch the refrigerant tubing, compressor, or any moving parts of the fan.
- (6) Unauthorized changes in the internal wiring can be very dangerous. The manufacturer will accept no responsibility for any damage or misoperation that occurs as a result of such unauthorized changes.
- (7) Regulations on wire diameters differ from locality to locality. For field wiring rules, please refer to your LOCAL ELECTRICAL CODES before beginning.
You must ensure that installation complies with all relevant rules and regulations.
- (8) To prevent malfunction of the air conditioner caused by electrical noise, care must be taken when wiring as follows:
 - The remote control wiring and the inter-unit control wiring should be wired apart from the inter-unit power wiring.
 - Use shielded wires for inter-unit control wiring between units and ground the shield on both sides.
- (9) If the power supply cord of this appliance is damaged, it must be replaced by a repair shop appointed by the manufacture, because special purpose tools are required.

2

3-2. Recommended wire length and wire diameter for power supply system

Outdoor unit

* AWG = American Wire Gauge

		(A) Power supply		Time delay fuse or circuit capacity	Power supply terminal base**		
		Wire size	Max. length		Capacity	Max. wire size	
R22	SPW-C1503GDYH8	10 mm ²	41 m	60 A	80 A	22 mm ²	(AWG #4)*
	SPW-C1903GDYH8	10 mm ²	33 m	80 A	80 A	22 mm ²	(AWG #4)*

3. Electrical Wiring

3-3. Wiring system diagrams

2

NOTE

- (1) Refer to Section 5-2. "Recommended Wire Length and Wide Diameter for Power Supply System" for the explanation of "A", "B", "C", "D", and "E", in the above diagrams.
- (2) The basic connection diagram of the indoor unit shows the 8P terminal board, so the terminal boards in your equipment may differ from the diagram.
- (3) R.C. Address should be set before turning the power on.
- (4) Regarding the R.C. Address setting, refer to page 86. Auto. address setting can be executed by a remote controller automatically. Please refer to the ENGINEERING MANUAL & TECHNICAL DATA of the ECO MULTI SYSTEM.

AS, SL, S, X, T, U,
D, F, FM Type

K Type

3. Electrical Wiring

CAUTION

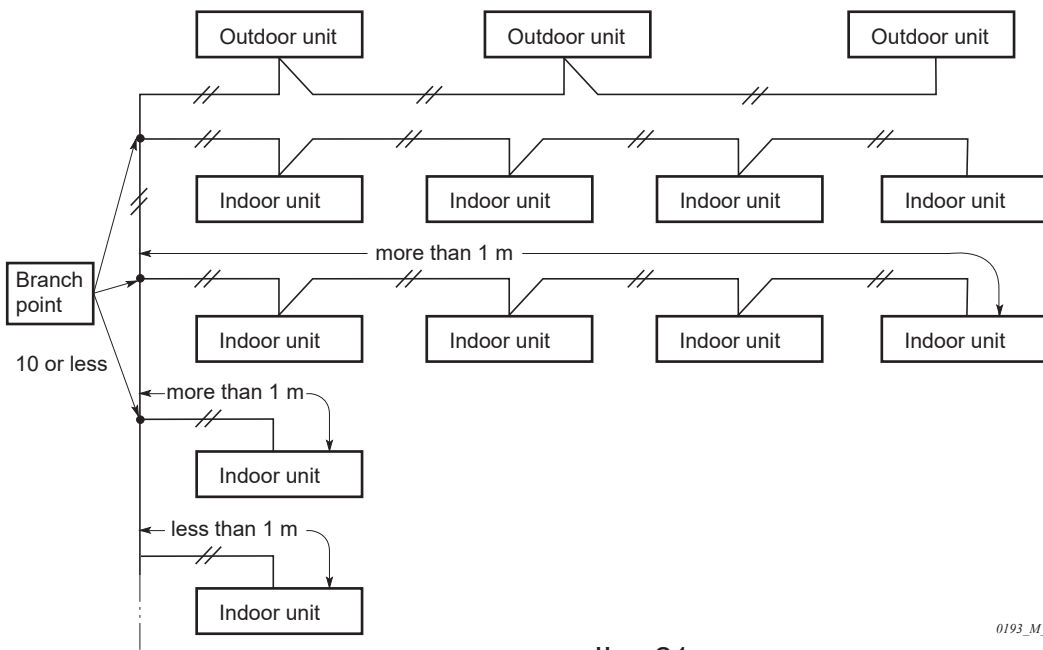

- (1) When linking outdoor units in a network (S-net link system), remove the short plug (CN031, 2P Black, location: right bottom on the outdoor control PCB) from all outdoor units except any one of the outdoor units. Otherwise the communication of S-net link system does not perform.
For a system without link (no connection wiring between outdoor units), do not remove the short plug.
- (2) Do not install the inter-unit control wiring in a loop.

- (3) Don't install the inter-unit control wiring such as star branch wiring. Star branch wiring causes mis-address setting.

- (4) If branching the inter-unit control wiring, the number of branch points should be 10 or less. (Branches less than 1 m are not included in the total branch number.)

3. Electrical Wiring

- (5) Use shielded wires for inter-unit control wiring (c) and ground the shield on both sides, otherwise misoperation from noise may occur.

All wiring except inter-unit control wiring (c) has polarity.

Connect wiring as shown in Section 5-3 "Wiring System Diagrams".

WARNING

Loose wiring may cause the terminal to overheat or result in unit malfunction. A fire hazard may also exist. Therefore, ensure that all wiring is tightly connected.

When connecting each power wire to the corresponding terminal, follow the instructions on "How to connect wiring to the terminal" and fasten the wire securely with the fixing screw of the terminal plate.

How to connect wiring to the terminal

■ For stranded wiring

- (1) Cut the wire end with cutting pliers, then strip the insulation to expose the stranded wiring about 10 mm and tightly twist the wire ends.
- (2) Using a Phillips head screwdriver, remove the terminal screw(s) on the terminal plate.
- (3) Using a ring connector fastener or pliers, securely clamp each stripped wire end with a ring pressure terminal.
- (4) Place the ring pressure terminal, and replace and tighten the removed terminal screw using a screwdriver.

3. Electrical Wiring

3-4. Maximum power input

- The maximum power input of the outdoor unit is a electric power input consumed when the outdoor unit is operated under the condition of the JIS cooling overload at the indoor / outdoor unit capacity ratio of 130 %.
- The maximum power input at the indoor / outdoor unit capacity ratio of less than 130 % can be calculated by multiplying the input coefficient calculated using the diagram below by the maximum power input.

● **How to calculate**

Find out the input coefficient from the intersecting point of the above indoor / outdoor capacity ratio graph.
 You can calculate by multiplying the input coefficient by the maximum power input.

4. Installation Instructions

4-1. Selecting the installation site

Indoor Unit

AVOID:

- areas where leakage of flammable gas may be expected.
- places where large amounts of oil mist exist.
- direct sunlight.
- locations near heat sources which may affect the performance of the unit.
- locations where external air may enter the room directly. This may cause "sweating" on the air discharge ports, causing them to spray or drip.
- locations where the remote controller will be splashed with water or affected by dampness or humidity.
- installing the remote controller behind curtains or furniture.

DO:

- select an appropriate position from which every corner of the room can be uniformly cooled.
- select a location where the ceiling is strong enough to support the weight of the unit.
- select a location where tubing and drain pipe have the shortest run to the outdoor unit.
- allow room for operation and maintenance as well as unrestricted air flow around the unit.
- install the unit within the maximum elevation difference above or below the outdoor unit and within a total tubing length from the outdoor unit as detailed in Table 1-20.
- allow room for mounting the remote controller about 1m off the floor, in an area that is not in direct sunlight nor in the flow of cool air from the indoor unit.

NOTE

Air delivery will be degraded if the distance from the floor to the ceiling is greater than 3 m. (for SL type, greater than 3.5 m)

Floor-Standing, Concealed Floor-Standing Type

Ceiling-Mounted Type

NOTE

The rear of the indoor unit can be installed flush against the wall.

Concealed-Duct Type 2-Way, 4-Way Semi-Concealed Type

4. Installation Instructions

4-2. Transporting

When transporting the unit, have it delivered as close to the installation site as possible without unpacking.

Use hook for suspending a unit type 190 and 150.

CAUTION

Rope or strap must be settled properly down at the bottom of the hook, not at the edge of the hook.

Remove one of the two bolts (M8) fixing the suspension plate, and screw the Eye-Bolt (field supply) at the position indicated. In the same way, attach the Eye-Bolts in the 4 positions.

Put the rope or strap through the hook of the Eye-Bolt.

When suspending a packaged unit, be sure to pass rope through the suspension plate at the bottom.

Lift the unit with its weight balanced and evenly supported.

To prevent damage, use protective material (such as cloth or cardboard) at all points where the lifting rope or strap touches the unit.

4-3. Installing the outdoor unit

- (1) Install a block or a solid platform under the outdoor unit which provides a minimum height of 5 cm from ground level.

1682_C_1

1691_C_1

0028_C_1

2

4. Installation Instructions

- (2) The types 70 and 90 must be bolted down through vibration insulators tightly to the blocks or platform with 4 anchor bolts.

CAUTION

The unit must sit on the vibration insulator and platform at least 10 mm wide at both ends.

- (3) The types 190 and 150 must be bolted down through vibration insulators tightly to the blocks or platform at 6 places including the center of the unit (Section A).

The center portion secure the vibration insulator with tapping screws by the aid of L-type fittings (local supply).

The vibration insulator should be secured to the outdoor unit through two holes equally spaced from the center of the unit bottom plate. Pitch : 100 mm. Same dimension for both back and front.

The unit must sit on the vibration insulator and platform at least 10 mm wide at both ends.

To be level with four anchor bolt securing positions.

4. Installation Instructions

4-4. Outdoor Unit

AVOID:

- heat sources, exhaust fans, etc.
- damp, humid or uneven locations.
- Indoor (no ventilation place)

DO:

- choose a place as cool as possible.
- choose a place that is well ventilated.
- allow enough room around the unit for air intake/ exhaust and possible maintenance.

0024_C_1

Installation space

Install the outdoor unit where there is enough space for ventilation. Otherwise the unit may not operate properly. Fig. 2-10 shows the minimum space requirement around the outdoor units when three sides are open and only one side is shuttered, with areas over the unit open. The mounting base should be concrete or a similar material that allows for adequate drainage. Make provisions for anchor bolts, platform height, and other site-specific installation requirements.

- Not more than 2 units should be installed adjacently.
- Leave space open above the unit.
- Construct louvers or other openings in the wall, if necessary, to ensure adequate ventilation.

CAUTION

NOTE

* Do not do any wiring or tubing within 60 cm of the front panel, because it is needed as a servicing space for the compressor.

PC and AD unit placed adjacently

1676_C_1

Conditions for installation: Fence height 1.8m, Effective opening ratio 50%, No raising for installation. The distances between the units will vary with changes in installation conditions.

4. Installation Instructions

4-5. Shield for horizontal exhaust discharge

It is necessary for you to install an air-discharge chamber (field supply) to direct exhaust from the fan horizontally if it is difficult to provide a minimum space of 2 m between the air-discharge outlet and a nearby obstacle.

CAUTION

In regions with heavy snowfall, the outdoor unit should be provided with a solid, raised platform and snow-proof vents.

0029_C_1

4-6. Installing the outdoor unit in heavy snow areas

In locations where wind-blown snow can be a problem, snow-proof vents should be fitted to the unit and direct exposure to the wind should be avoided as much as possible. The following problems may occur if proper countermeasures are not taken:

- The fan in the outdoor unit may stop running, causing the unit to be damaged.
- There may be no air flow.
- The tubing may freeze and burst.
- The condenser pressure may drop because of strong wind, and the indoor unit may freeze.

4-7. Precautions when installing in heavy snow areas

- a) The platform should be higher than the maximum snow depth.
- b) The 2 anchoring feet of the outdoor unit should be used for the platform, and the platform should be installed beneath the air-intake side of the outdoor unit.
- c) The platform foundation must be solid and the unit must be secured with anchor bolts.
- d) When installing on a roof subject to strong wind, countermeasures must be taken to prevent the unit from being overturned.

4. Installation Instructions

4-12. Optional ball valve kits

See the installation instructions packaged with the ball valve kit for the procedure for installation.

Model name		Contents	Applicable outdoor unit	Indoor unit cooling capacity after the ball valve
for R407C	for R22			
BV-XR125B	BV-X125B	* 38.1 (1- 1/2)	190, 150 type	40 ~ 70 kW
		15.88 (5/8)		
BV-XR94B	BV-X94B	* 28.58 (1- 1/8)	90 type	~ 28 kW
		12.7 (1/2)		
BV-XR84B	BV-X84B	* 25.4 (1)	70 type	~ 22.4 kW
		12.7 (1/2)		
BV-XR63B	BV-X63B	19.05 (3/4)	(36, 48 type)	~ 16 kW
		9.52 (3/8)		
BV-XR53B	BV-X53B	15.88 (5/8)	-	~ 9 kW
		9.52 (3/8)		
BV-XR43B	BV-X43B	12.7 (1/2)	-	~ 3.6 kW
		9.52 (3/8)		
BV-R3B	BV-3B	9.52 (3/8)	for Balance tube	-

* Marked ball valves are brazing type and the others are flare connecting type.

CAUTION

Referring to the above chart, make sure that your ball valve is suitable for your refrigerant. The ball valve used for R22 refrigerant is different from one used for R407C (No-interchangeability).

Figure	Ball valve size mm (in.)	Dimension (mm)																													
		A	B	C	D	E

1. Main Operating Functions

1-1. Room temperature control

The thermostat turns ON / OFF with the following ΔT .

$\Delta T = \text{Room temp} - \text{Set temp}$	
With body thermostat	Room temp = (Body sensor) - (Shift temp*)

- * Shift temp (valid while heating, only) is set when shipped from factory as follows:
- +4 deg: all type except wall mounted and floor standing type
 - +2 deg: wall mounted type
 - 0 deg: floor standing type
- Shift temp can be set with Remote controller from +1 to +10 deg.

634_8132

Supplement:

- (1) After thermo.-on, it will not thermo.-off for 3 minutes due to ΔT . However, for heating, if the indoor coil E2 temperature $\geq 64^\circ\text{C}$, it will thermo.-off within 5 minutes (over load protection).
- (2) After thermo.-off, it will not thermo.-on for 1 ~ 3 minute. For cooling or dehumidifying, it will not thermo.-on if the indoor coil E1 or E2 temperature $< 2^\circ\text{C}$.
- (3) When the system is set for test operation, it will not thermo.-off for 60 minutes (forced thermo.-on).

1-2. Fan speed control

(1) Control in special conditions

Reverse cycle start control	• Cooling, dry operation : Set fan speed
Oil recovery control	• Heating : OFF
Reverse cycle defrost control	• OFF or LL
Switch over control	• When switching over from cooling, dry, or fan to heating : OFF • When switching over from heating to cooling, dry, or fan: Set fan speed

- (2) Fan operation : Set fan speed
- (3) Dry operation : L
- (4) When thermo. OFF

Cooling	Set fan speed
Heating	<p>* Operation of L or LL cycle when comp. on.</p> <p>* Operation of LL when comp. off.</p>

- * For all units except wall mounted type.
In case of wall mounted type, only LL airflow blows when thermo. OFF.

(5) When thermo. ON

Cooling operation	<ul style="list-style-type: none"> • Auto setting : Conforms to the procedure of "Fan speed auto control" • Regular fan speed setting : Conforms to the set fan speed
Heating operation	<ul style="list-style-type: none"> • At start of operation : Conforms to the procedure of "Cold draft prevention" • Later <ul style="list-style-type: none"> - Fan speed auto setting : Conforms to the procedure of "Fan speed auto control" - Regular fan speed setting : Conforms to the set fan speed

- **Fan speed auto control : Controlled by ΔT (Room temp - Set temp)**

1278_X_1

Supplement

The following heating controls receive priority, while heating.

1. Main Operating Functions

● Heating operation control

- ① During heating operation, the "Set fan speed" is set as follows after the thermostat turns ON.

1016_1143

- ② The following control takes place after reaching the set fan speed.

1017_1143

NOTE

E2: Indoor coil temp.

1-3. Auto flap control

[Applicable indoor units]
4-Way, 2-Way, & ceiling mounted

- The airflow direction can be set at 5 stages with **FLAP setting button**.

Flap position according to the operating state

		4-Way 2-Way	Ceiling mounted
Fan	Initial setting	F2	F1
	Manual setting	F1 ~ F5	
Cooling, dry	Initial setting	F2	F1
	Manual setting	F1 ~ F3	
Heating (H / Me)	Initial setting	F4	
	Manual setting	F1 ~ F5	
Heating (L)	Initial setting	F4	
	Manual setting	F1 ~ F4	
Sweep		F1 ~ F5	
Heating stand by		F2	
When stopped		F5	

Flap position

636_8132

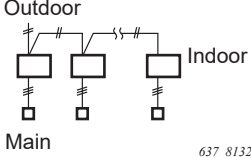

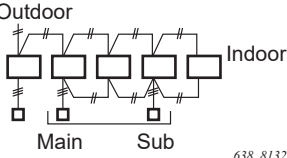

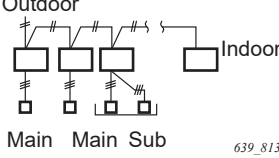

- * Movement of flap
When changing from F4 to F3
moves once through F5 & F1,
and then set at F3.
(F4 → F5 → F1 → F2 → F3)

3

1. Main Operating Functions

1-4. Functions for group control & multiple remote control

Group control and multiple remote control become possible by using remote controllers; however part of the functions of the main and sub remote controller cannot be controlled. So, confirm them referring to the following table.

	Individual remote control (standard)	Group control		Multiple remote control	
Diagram of system outline					
Remote control functions	Each remote controller	Main remote controller	Sub remote controller	Main remote controller	Sub remote controller
ON / OFF	○	○ (Collective, later pressed priority)	○	○ (Later pressed priority)	○
Operation Mode switch	○	○ (Collective, first pressed priority *1)	○	○ (First pressed priority *1)	○
Temp setting	○	○ (Collective, later pressed priority)	○	○ (Later pressed priority)	○
Fan speed setting (H / Me / L / auto)	○	○ (Collective, later pressed priority)	○	○ (Later pressed priority)	○
timer 72 hr ON / OFF	○	○ (Timer setting with sub impossible)	×	○ (Timer setting with sub impossible)	×
Auto flap	Arbitrary airflow direction setting	○	○	○ (Later pressed priority)	○
	Sweep	○	○	○ (Later pressed priority)	○
Sensor temp. display	○	○	○	○	○
Service check	○	○	○	○	○

NOTE

To use as a sub unit (sub remote controller), the remote control address switch of its remote control PCB must be set ON.

*1 In ECO & W-ECO multi system, first pressed cooling (dry) or heating mode has priority, different mode can not be selected later except fan mode.

If you select a different mode later, the indication "MODE FIXED" will be displayed on remote controller.

2. Optional Controller

■ List of optional controller functions

● Remote controller functions

In multi system, the following optional remote controllers can be selected, but there are some functions which cannot be controlled. So, confirm the usable functions from the following table at the time of selecting them.

○: Controllable X: Uncontrollable

		Remote Controller	System Controller	Simplified Remote Controller
		RCS-SH80TG	SHA-KC64TG	RCS-KR1TG
ON / OFF		○	○ (Collective/Individual)	○ (Collective/Individual)
Operation mode switch	Heating	○	○ (Individual)	○ (Individual)
	Dry	○	○ (Individual)	○ (Individual)
	Cooling	○	○ (Individual)	○ (Individual)
	Fan	○	○ (Individual)	○ (Individual)
Temp setting		○	○ (Individual)	○ (Individual)
Fan speed setting (H / Me / L / auto)		○	○ (Individual)	○
Auto flap	Auto airflow direction setting	○	○	X
	Arbitrary airflow direction setting	○	*2 ○	X
Sweep (Flap swing)		○	*2 ○	○
72 hr ON / OFF timer		○	X	X
Sensor temp display		○	X	X
Self-diagnostic function (as sub controller) * 3		○	○	X
Cumulative operation time * 3		X	X	X
System	Central control (at hand inhibited)	X	○	X
	Group control	○ (Up to 8 units)	○ (Up to 16 groups)	○
	Multiple units set in parallel (as sub controller) *1	○	○	○
	Multiple units set in parallel (as main controller)	○	○	○
	Concurrent use as weekly timer	○	○	X
Setting range	Cooling, dry (°C)	18 ~ 30		18 ~ 30
	Heating (°C)	16 ~ 26		16 ~ 26

NOTE

* 1 To use as a sub controller, the address switch of its remote control PCB must be set (from OFF to ON.).

* 2 This function is not useable for indoor unit which is connected remote controller.

* 3 This function is to estimate the simple electrical charge.

NOTE

If you use both remote controller and system controller concurrently, both controller can be used on a last-signal priority basis.

2. Optional Controller (remote controller)

2-1. Remote controller / RCS-SH80TG

■ How to use the remote controller

642_8132

A:	ON/OFF operation button	This button is for turning the air conditioner on and off.
B:	Operation lamp	This lamp lights when the air conditioner is turned on.
C:	MODE button	Use this button to select one of the following five operations: ☀️ (HEAT) Used for normal heating operation. (temperature range: 16 - 26 °C) 💧 (DRY) Used for dehumidifying without changing the room temperature. (temperature range: 18 - 30 °C) ❄️ (COOL) Used for normal cooling operation. (temperature range: 18 - 30 °C) 🌀 (FAN) Used to run the fan only, without the heating or cooling operation. <div style="border: 1px solid black; padding: 2px; display: inline-block;">NOTE</div> When the MODE FIXED indication is displayed, change the setting with the MODE button, or turn off all units once then select the mode again.
D:	Temperature setting buttons	▲ : Press this button to increase the set temperature. ▼ : Press this button to decrease the set temperature.

2. Optional Controller (remote controller)

E: FAN SPEED button	 <p>The air conditioner automatically decides the fan speed.</p> <p>High fan speed</p> <p>Medium fan speed</p> <p>Low fan speed</p>						
F:  button (Filter)	<p>Use this button to reset the filter sign  (timer). The air conditioner has the timer for filter and informs you the time of cleaning the filter.</p>						
G: TEST RUN / CHECK  CAUTION	<p>This button is used only when servicing the air conditioner.</p> <p>Do not use the TEST / CHK button for normal operation.</p>						
H: FLAP button  CAUTION	<p>Use this button to set the airflow direction at a specific angle or to make the airflow direction sweep to up and down automatically (SWEEP). Airflow direction or SWEEP indication is displayed on the remote controller.</p> <table border="1" data-bbox="715 738 1380 847"> <thead> <tr> <th>Operation mode</th> <th>Number of airflow direction settings</th> </tr> </thead> <tbody> <tr> <td>COOL or DRY</td> <td>3</td> </tr> <tr> <td>HEAT or FAN</td> <td>5</td> </tr> </tbody> </table> <ul style="list-style-type: none"> ● In the cool mode and dry mode, if the flaps are set in a downward position, condensation may form and drip around the vent. ● Do not move the flap with your hands. 	Operation mode	Number of airflow direction settings	COOL or DRY	3	HEAT or FAN	5
Operation mode	Number of airflow direction settings						
COOL or DRY	3						
HEAT or FAN	5						
I: TIMER SET button	<p>Use this button to set the timer at which you wish the air conditioner to go on or off.</p> <p> : The air conditioner stops after the length of time set.</p> <p>  : The air conditioner stops after the same set time every time.</p> <p> : The air conditioner starts after the length of time set.</p>						
J: Timer setting buttons  Press this button to increase the time.  Press this button to decrease the time. NOTE	<ul style="list-style-type: none"> ● When more than one remote controller is being used with the twin-type, triple-type, etc, a sub remote controller can not be used for timer operations. ● If a power failure occurs, the time counted up to that point will be memorized. After the power is restored, the timer again starts counting up to the set time. 						
K: Unit button	<p>Use this button to select the indoor unit in case of group control. Cannot be used in other case.</p>						
L: CLEAR button	<p>Use this button to clear the timer setting.</p>						
M: SET button	<p>Use this button to set the timer setting.</p>						

- NOTE**
- 1) When multiple remote controllers are used, the most recent button that is pressed on any remote controller is effective, except for timer operations and mode setting.
 - 2) When "CENTRAL CONTROL" is displayed on the LCD, any operation (setting) is made by system controller. When "CENTRAL CONTROL" is flashing on the LCD, ON/OFF operation is not accepted by system controller (remote control inhibited).

2. Optional Controller (remote controller)

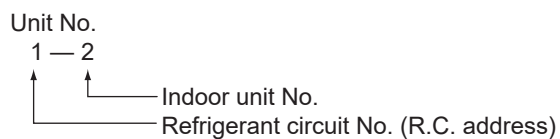

Display (Remote controller)

0180_M_I

Description

- A** : When the unit is in the heating standby mode, the STANDBY indicator appears.
- B** : The currently selected operation mode is displayed.
- C** : This is displayed in case a different operation mode was selected already.
- D** : The currently selected FAN SPEED, FAN AIM and SWEEP status are displayed.
- E** : This is displayed only if an abnormality occurs within a unit.
- F** : This indicates the indoor unit address in case of group control.

- G** : This is displayed if it is time to clean the filter.
- H** : This is displayed during central control.
- I** : When setting the timer, the selected timer mode is displayed.

2. Optional Controller (remote controller)

■ Setting the Timer

OFF ↻

OFF timer

Use this mode to turn off the appliance automatically after the length of time set.

ON ↻

ON timer

Use this mode to start the appliance automatically after the length of time set.

↻ OFF ↻

OFF cycle timer

Use this mode to turn the appliance off automatically after the same set time every time.

NOTE

- When more than one remote controller is being used a sub-remote controller can not be used for timer operations.

2. Optional Controller (remote controller)

How to set the OFF timer (OFF)

(Example) To stop the air conditioner after 3:30.

Operation	Indication	
  	<p>1. Press the ON / OFF button to start the air conditioner.</p> <p>2. Press the TIMER SET button to select OFF mode.</p> <p>3.</p> <ul style="list-style-type: none"> ● Press the ▲ button until 3.5 is displayed. ● Press the ▼ button if the set time is overexceed. <p>4. Press the SET button to set the OFF timer.</p>	<p>→ The SETTING and time indications flash.</p>

How to set the OFF cycle timer (OFF)

(Example) To stop the air conditioner after 3:30 everytime

Operation	
	<p>1. Press the ON / OFF button to start the air conditioner.</p> <p>2. Press the TIMER SET button to set OFF .</p> <p>3. Set the time using ▲ ▼ button.</p> <p>4. Press the SET button to set the OFF cycle timer (OFF).</p>

NOTE

When the OFF cycle timer is set, the unit will stop after 3:30 every operation.

How to set the ON timer (ON)

(Example) To start the air conditioner after 10:30.

Operation	Indication	
  	<p>1. Press the ON / OFF button to start the air conditioner.</p> <p>2. Press the TIMER SET button to select ON mode.</p> <p>3.</p> <ul style="list-style-type: none"> ● Press the ▲ button until 10.5 is displayed. ● Press the ▼ button if the set time is overexceed. <p>4. Press the SET button to set the ON timer.</p>	<p>→ The SETTING and time indications flash.</p>

NOTE

When the ON timer is set, the unit enters the paused state.

2. Optional Controller (remote controller)

■ How to install the remote controller

Remote controller wiring can be extended to a maximum of 1,000 m.

CAUTION

- Do not twist the control wiring with the power wiring or run it in the same metal conduit, because this may cause malfunction.
- Install the remote controller away from sources of electrical noise.
- Install a noise filter or take other appropriate action if electrical noise affects the power supply circuit of the unit.

The mounting position for the remote controller should be located in an accessible place for control. Never cover over the remote controller or recess it into the wall.

- (1) When you open the decorative cover, you will see two gaps under the remote controller. Insert a coin into these gaps and pry off the back case.

■ When using a wall box for flush mounting

- If local codes allow, this remote controller can be mounted using a conventional wall box for flush mounting.
- (2) Attach the back case with the 2 small screws provided. Using a screwdriver, push open the cut-outs on the back case. These holes are for screws. Use the spacers and take care not to tighten the screws excessively. If the back case will not seat well, cut the spacers to a suitable thickness.
 - (3) Connect the remote controller wiring (3 wires) correctly to the corresponding terminals in the electrical component of the indoor unit.

CAUTION

When wiring, do not connect the remote controller wires to the adjacent terminal block for the power wiring. Otherwise, the unit will break down.

- (4) To finish, fit the back tabs of the case into the remote controller and mount it.

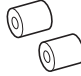

CAUTION

Do not supply power to the unit or try to operate it until the tubing and wiring to the outdoor unit is completed.

1779_M_1

No.	Accompanying parts	Qty
①	Remote controller (comes with 20 cm wire)  651_8132	1
②	Machine screws M4 x 25  652_8132	2
③	Wood screws  653_8132	2
④	Spacers  654_8132	2

No.	Accompanying parts	Qty
⑤	Clamper  655_8132	2
⑥	Wire joints  656_8132	3

2. Optional Controller (remote controller)

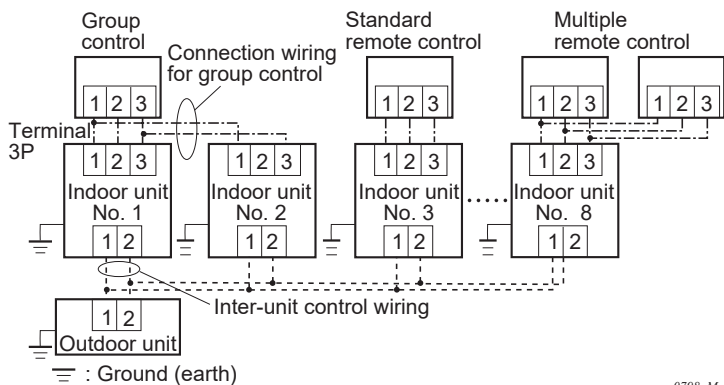

■ Basic wiring diagram

CAUTION

Install wiring correctly
(incorrect wiring will damage the equipment).

- Use shielded wires for inter-unit control wiring and ground the shield on both sides. Otherwise misoperation because of noise may occur.

Recommended wire diameter and wire length

Inter-unit control wiring	Remote control wiring Control wiring for group control
0.75 mm ² (AWG #18) Use shielded wiring*	0.75 mm ² (AWG #18)
Max. 1,000 m (Total)	Max. 500 m (Total)

● Wiring procedure

Install the wiring according to the above wiring diagram.

- The address setting is automatically executed after turning on the system.
An indoor unit address is assigned to each indoor unit.
- Operation takes place successively at intervals of 1 second, by using combinations of the address setting of each unit.

● Diagram of outer dimensions

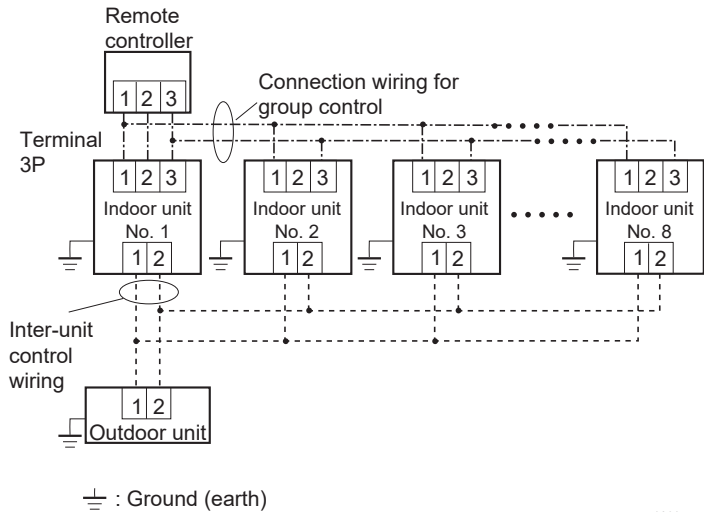

1780_M_1

TD831077

2. Optional Controller (remote controller)

■ Wiring system diagram for group control

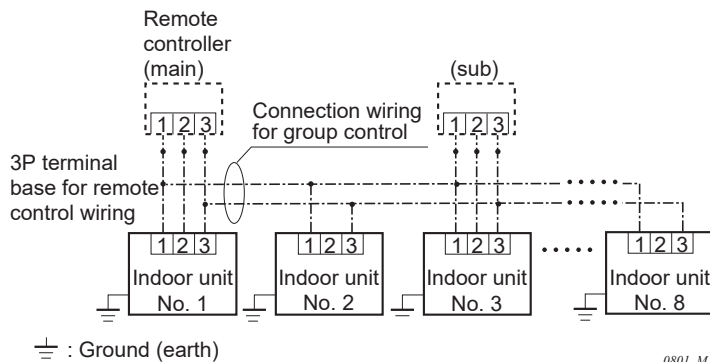

This diagram shows when several units (maximum of 8) are controlled by a remote controller (master unit). In this case, a remote controller can be connected at any indoor unit.

0800_M_1

● Group control using 2 remote controllers.

It does not matter which of the 2 remote controllers you set as the main controller.

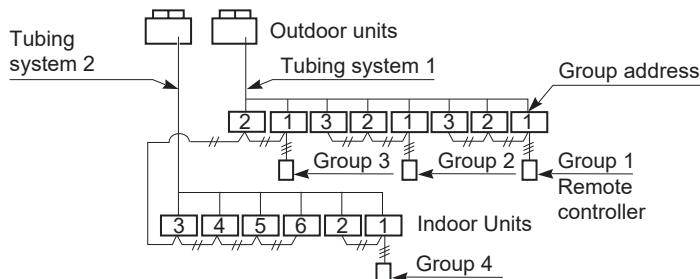

0801_M_1

NOTE Cautions on group control

● Group control within the same refrigerant tubing system is recommended.

[Tubing system which is not recommended]

0195_M_1

Wiring procedure

Wire according to the left diagram:

- Address setting is executed automatically when the outdoor unit is turned on.
- Each successive unit will respond at one-second intervals following the order of the group address when the remote controller is operated.

When using multiple remote controllers (up to 2 of them can be used), one is the main remote controller and the other is the sub-remote controller.

- To set up a sub-remote controller, turn its remote control address switch (RCU. ADR) located on its PCB from OFF to ON (OFF: when shipped from factory).

3

Example.1 In the ECO multi system, group control extending over tubing systems becomes impossible to set, giving rise to indoor units which cannot operate.

While group 4 is in heating operation, if later group 3 begins cooling operation, indoor units 1, 2 of group 3 can be operated, but the indoor units 3-6 of group 4 cannot operate.

2. Optional Controller (remote controller)

■ Wiring system diagram for multiple remote control

● When Installing Multiple Remote Controllers

This multiple remote controller system is used for operating the unit(s) at different positions. (A maximum of 2 remote controllers can be installed.)

● Setting method

To execute this control, make the setting according to the following procedure.

- ① Of the two installed remote controllers, make one the main remote controller (factory-shipped state).
- ② On the other remote controller, turn the address switch on the PCB from OFF to ON.
In this state, it functions as a sub-remote controller.

● Basic wiring diagram

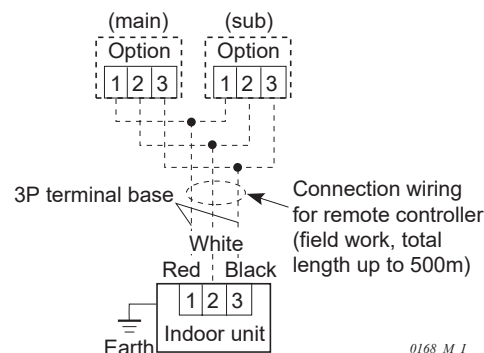

CAUTION

Install wiring correctly (incorrect wiring will damage the equipment).

- To operate 1 indoor unit with 2 remote controllers set at different places.

0802_M_1

0168_M_1

2. Optional Controller (remote controller)

■ Service functions of remote controller

From the remote controller you can control both the operation and settings of the unit as well as perform several useful service checks. This section explains how to use the remote controller to:

- (A) Set service check switches.
- (B) Use the test run procedure.
- (C) Check the sensor temperature readings.
- (D) Find out about past service problems.
- (E) Check the remote controller itself for correct operation.
- (F) Execute the auto. address operation.
- (G) Confirm and change the indoor unit address.
- (H) Change the shift temperature in heating mode
- (I) Set the indoor unit address.
- (J) Change the period of the filter timer

(A) Set service check switches

The service check switches are located on the back of the remote controller's P.C.B. Ass'y as follows :

665_8132

The following are the correct switch settings for normal use of the unit. Only change the settings temporarily for making service checks. When you have changed the settings, **be sure to return them to the standard settings** shown here.

- RCU.CK** switch - Refer to section (E) “ **Checking the remote controller for correct operation**”
- RCU.ADR** switch - Keep the switch **OFF** all the time except in case of sub remote controller

2. Optional Controller (remote controller)

(B) Use the test run procedure

- ❑ The purpose of the test run function is to let you control the operation of the unit directly without the thermostat turning the unit on or off. As indicated in the following procedure, be sure to switch out of TEST RUN when you are finished, or the air conditioner can be damaged because it won't cycle on and off normally.
- ❑ To protect the air conditioner from overloading, the outdoor unit will not start running for 3 minutes after power is applied or the unit is turned OFF.

- a Press the **TEST / CHK** button at the bottom right on the remote controller.
- b Press the ON / OFF operation button to start the test run.
- c Press the **MODE** button to select either COOL or HEAT mode.
- d When the test run has started, "TEST" shows on the remote controller's display.
- e During the test run, the air conditioner runs continuously and the thermostat does not control the system.
- f After the test run, be sure to press the **TEST / CHK** button once again to cancel this mode and be sure "TEST" is not shown on the display.

1152_THS_1

The TEST RUN button is used only for servicing the air conditioner. Do not press this button for normal operation, or the system may be damaged.

2. Optional Controller (remote controller)

(C) Check the sensor temperature readings

The air conditioner has temperature sensors placed in areas where temperature levels control the heating or cooling process.

- Each sensor has an address which is made up of the indoor unit address, and the sensor address. The indoor unit address is used only when several units are hooked up to one remote controller (group control). If there is only one unit, made up of one indoor and one outdoor component, then only the sensor address must be put in, as shown in the procedure below.

Follow this procedure to display the temperature of each sensor:

- a) On the remote controller, press both **TEST / CHK** and **CL** buttons at the same time for more than 4 seconds.

- b) Once in this mode, the UNIT No., the address and temperature of the sensors instead of its usual information will flash on the display.

NOTE

Do not press **TIMER SET** button during checking.

- For this example the UNIT No. (Indoor unit address) is fixed at **01-01**.
- In case of group control, select the UNIT NO. (Indoor unit address) which you want to call with **UNIT** button.
- Each time you press the **▲**, **▼** (SET TEMP.) button you select a different sensor, and the display shows the sensor address and temperature as shown below.

2. Optional Controller (remote controller)

Refer to the table below for the relationship between the sensor address and the location of the sensor.

Relationship between the sensor address and the location of sensor

Sensor Address (CODE No.)		Location of Sensor (Themistor)				
Indoor Unit	01				—	
	02	TH1	Indoor air suction Temp.			
	03	TH2	Indoor coil Temp. (E1)			
	04	TH3	Indoor coil Temp. (E2)			
	05	TH4	Indoor coil Temp. (E3)			
	06	TH5	Indoor Discharge air Temp.			
	07				—	
	08		Indoor Electronic Control Valve Open			
	09				—	
Outdoor Unit		PC unit			AD unit	
	0A	TH1	Discharge gas Temp. (PC Compressor)	—		
	0B	TH2	Discharge gas Temp. (AC Compressor)	—		
	0C	TH6	Outdoor coil Temp. (Right coil)	1C	TH3	Outdoor coil Temp.
	0D	TH7	Outdoor coil 1 gas Temp. (Right coil)	1D	TH4	Outdoor coil gas Temp.
	0E	TH4	Outdoor coil 1 liquid Temp. (Right coil)	1E	TH2	Outdoor coil liquid Temp.
	0F	TH8	Outdoor coil 2 gas Temp. (Left coil)	—		
	10	TH5	Outdoor coil 2 liquid Temp. (Left coil)	—		
	11	TH9	Outdoor air suction Temp.	21	TH5	Outdoor air suction Temp.
	12		—	—		
	13		PC Compressor Current	—		
	14		AC Compressor Current	—		
	15		—	—		
	16		—	—		
	17	TH3	Discharge gas Temp. (SC Compressor)	27	TH1	Discharge gas Temp. (SC Compressor)
	18		SC Compressor Current	28		SC Compressor Current

- (PC or PC Comp. or Compressor : Power Control Compressor
 AC Comp. or AC Compressor : Standard Compressor
 SC Comp. or SC Compressor : Scroll Compressor

NOTE

In case there are no sensor equipped with the unit, - - - is shown on the display.

© Resetting the remote controller display back to normal.

- To reset the display when you are finished, press **TEST / CHK** button, then the remote controller will return to previous mode.

(D) Find out about past service problems

The remote controller can store the **max. 4 most recent alarm codes**, so you can see what kind of problems the unit has had, if any. Knowing what has already happened and been fixed helps you know what to check at present.

- This function is usable even if the unit is not working.
 To display the past error codes, follow the procedure below.

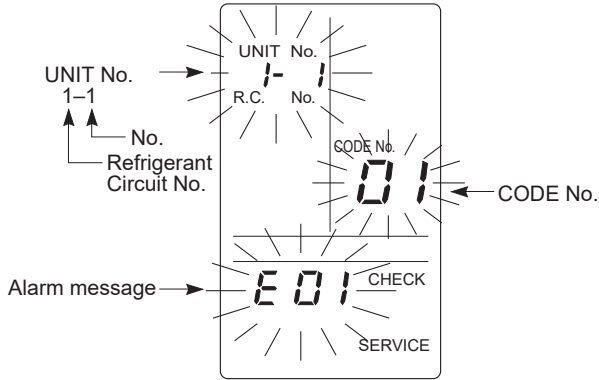

Procedure:

- ① On the remote controller, press both **TEST / CHK** and **SET** buttons at the same time for more than 4 seconds.
 ② Once in this mode, a change from the normal display to service check display takes place, as shown in the table below:

NORMAL DISPLAY	Display Change (→)	SERVICE CHECK DISPLAY
Set temp.	→	Code No.
UNIT No.	→	UNIT No. (Indoor unit address)
Hours, Minutes	→	Alarm Message

2. Optional Controller (remote controller)

The panel now shows this display as shown below.

778_8132

- ©. A maximum of 4 alarm messages can be accessed by pressing either **SET TEMP** button ▲ or ▼ as follows.

779_8132

NOTE Pressing **CL** (Clear) button will clear all the service history.

▲ ... accessed in order of "Past → Present".

▼ ... accessed in order of "Present → Past".

For example, if the last four alarm messages were, in order of occurrence from oldest to most recent, **P01**, **P02**, **P04**, and most recently **E01**, then the display would look as shown below as you pressed ▼ four times. The 5th time you pressed ▼ you would start the display cycle over, and the first message would be shown again.

If there are no alarm messages, the display shows:

0864_M_1

2. Optional Controller (remote controller)

Important

Never press **CL** button unless you want to erase the accessed data in memory. Follow the procedure below only when erasing is necessary.

- To erase accessed data, press the **CL** button.
- When erasing is finished, ---- shows on the controller's display.

After checking the alarm messages be sure to press the **TEST / CHK** button.

(E) Check the remote controller itself for correct operation

The remote controller has a **self-diagnostic** function to check if it works properly. Use this procedure to find out if the remote controller itself is defective:

- a) Turn ON the **RCU.CK** switch on the back of the **P.C.B.** Ass'y in the remote controller. See section **(A)** for exact location.
- b) The appearance of the display will tell you whether or not the remote controller is working correctly or not.
 - Normal condition** – All displays appear for 10 seconds, then disappear.
 - Adnormal condition** – All displays flash ON and OFF for 10 seconds, then disappear.

After checking the panel, be sure to set the **RCU.CK** switch to this original **OFF** position.

2. Optional Controller (remote controller)

(F) Execute the auto. address operation

- Auto. address operation is executed by pressing the A. ADD button of outdoor unit's PCB usually (See "Test Run" V-2 ~).
For your convenient it can be executed by remote controller also.

- a Press the **TEST / CHK** and ▲ (⌚) buttons at the same time for more than 4 seconds.
- b Set CODE No. A1 with ▲ , ▼ (**SET TEMP**) button.

In this mode, the auto. address operation is executed at each R.C. line one by one.

- c Select R.C. No. which you want to execute the auto. address operation with **UNIT** button.
- d Press the **SET** button. The auto. address operation will start. CODE No. changes from flashing to ON state.
- e If the error is happened during the operation, the alarm message will display. Check and remove the cause. If you want to interrupt the operation, press the **CL** button then the unit stands in waiting mode (Press the **SET** button).
- f If the auto. address operation finishes, the display will disappear.
- g Execute the operation of the other R.C. line in the same way by following the above steps c to d .
- h Complete the auto. address operation by pressing the **TEST / CHK** button.

2. Optional Controller (remote controller)

(G) Confirm and change the indoor unit address

- The purpose of the above function is to let you confirming the indoor unit address after the auto. address operation, and changing the indoor unit address if it is needed.

- ① Press the **TEST / CHK** and **⏻** () buttons at the same time for more than 4 seconds.

- ② Select the R.C. No. which you want to change with the **UNIT** (up) or **FLAP** (down) buttons.
- ③ Press the SET button (to confirm the R.C. No.).
The smallest registered indoor No. and the selected R.C. No. will display.

Ex:

R.C. No. 3 is selected.

Indoor No. 2 is smallest indoor No. of the R.C. No. 3.

- ④ Select the indoor No. which you want to change with **UNIT** button. Once in this mode, **the fan motor of selected indoor unit will turn on and let you confirming the indoor unit address.**

: Confirming the indoor unit address

2. Optional Controller (remote controller)

- Ⓔ Set the required new indoor No. by pressing the ▲ , ▼ (⌵) button.

Ex: UNIT No. 3-6: current registered the indoor unit address

Required new indoor No.8: SET DATA

* In this case, UNIT No. 3 – 6 (current)

↓
3 – 8 (NEW : after pressing the
TEST / CHK button)

795_8132

- Ⓕ Press the SET button.
UNIT No, SET DATA (0008) and **SETTING** changes from flashing to ON state.
- Ⓖ If you make mistake press the **CL** button.
- Ⓗ Finally, press the **TEST / CHK** button.
- Ⓘ If you want to change the indoor unit address of the other R.C. No., follow the step Ⓔ to Ⓗ in the same way.

2. Optional Controller (remote controller)

(H) Change the shift temperature in heating mode

- ❑ If the indoor unit is installed at high location (ex. ceiling level), the thermostat tends to turn off early in heating mode because of the hot air temperature of ceiling level. In order to resolve the problem, the shift temp. (valid while heating only) is set when shipped from factory (refer to room temp. control P. III-2).
- ❑ If the shift temp. is not enough (ex. the indoor unit is installed at position higher than 3 m), the shift temp. can be set with remote controller from +1 to +10 deg manually as follows:

- (a) Press the **TEST / CHK** button for more than 4 seconds.

- (b) In case of group control, if you want to change all units in group control collectively, proceed next step remaining **ALL** displayed. If you want to change a unit individually, select the indoor unit address (UNIT No.) with **UNIT** button.
- (c) Select the CODE No. 06 with ▲, ▼ (**SET TEMP**) button.
- (d) Choose the shift temp with ▲, ▼ (⌚) button.

EX:
 UNIT No. 1-6
 CODE No. 06
 Shift temp. +5 deg

- (e) Press the **SET** button. CODE No. 06, SET DATA and **SETTING** change from flashing to ON state.
- (f) If you make mistake, press the **CL** button.
- (g) Finally, press the **TEST / CHK** button.

2. Optional Controller (remote controller)

(1) Set the indoor unit address

- This function is usable if the auto. address operation is not possible.
Indoor unit address can be set one by one by remote controller in such case.

NOTE

- 1) In case of group control, branch wiring for group control should be removed temporarily.
- 2) In case of remote controller – less system, remote controller should be connected with the indoor unit temporarily.

- a) Short the two terminals of DISP PIN on indoor unit PCB.
(DISP PIN : Refer to P. VI-2)
- b) Press the **TEST / CHK** , **SET** and **CL** buttons at the same time for more than 4 seconds.

- c) Set the CODE No. 12 to set the No. of R. C. with the ▲ , ▼ (**SET TEMP**) button.

2. Optional Controller (remote controller)

- d Set the No. of R. C. which you want to set with ▲ , ▼ (⌵) button.

Ex. No. of R. C. will be set 2.

- e Press the **SET** button.
UNIT No., CODE No. 12, **SETTING** and SET DATA (0002) change from flashing to ON state.
- f Select the CODE No. 13 to set the indoor unit No. with the ▲ , ▼ (**SET TEMP**) button.
- g Set the indoor unit No. which you want to set with the ▲ , ▼ (⌵) button.

Ex. Indoor unit No. will be set 4.
In this example, indoor unit address (UNIT No.) will be set 2-4.

- h Press the **SET** button.
UNIT No., CODE No. 13, **SETTING** and SET DATA (0004) change from flashing to ON state.

3

2. Optional Controller (remote controller)

- ① Select the code No. 14 to set group setting with the ▲ , ▼ (SET TEMP) button.
- ② Set the No. of group setting as shown below with the ▲ , ▼ (⌚) button.

- 0 : Standard system (except group control)
- 1 : Main indoor unit in case of group control
- 2 : Sub indoor unit in case of group control
- 99 : No setting (at factory shipment)

- Ⓚ Press the **SET** button.
UNIT No., CODE No. 14, **SETTING** and SET DATA change from flashing to ON state.
- ① If you make mistake, press the **CL** button so that setting changes the initial state.
- Ⓜ Press the **TEST / CHK** button to finish this mode.
The display is disappeared.
- Ⓝ Confirm the indoor unit address (UNIT No.) with the **UNIT** button after pressing the **ON / OFF** button.
- Ⓞ Finally, remove the short circuit of DISP PIN.
And in case of group control, be sure to restore the branch wiring to its original wiring. In case of remote controller-less system, remove the remote controller.

2. Optional Controller (remote controller)

(J) Change the period of the filter timer

- If the period of filter timer is not suitable (for example in case of dirty environment), the period can be half done as follows:

- a) Press the **TEST / CHK** button for more than 4 seconds.

0213_M_1

- b) In case of group control, if you want to change all units in group control collectively, proceed next step remaining ALL displayed.
If you want to change a unit individually, select the indoor unit address (UNIT No.) with **UNIT** button.
- c) Select the CODE No. 02 with ▲ , ▼ (**SET TEMP**) button.
- d) Change the No. from 0 to 1 with ▲ , ▼ (⊖) button.

0214_M_1

EX:

UNIT No. 1-6

CODE No. 02

{	X, S, T, SL type	2,500 hr	→	1,250 hr
	AS, K, F, FM type	150 hr	→	75 hr

- e) Press the **SET** button.
CODE No. 06, SET DATA and **SETTING** change from flashing to ON state.
- f) If you make mistake, press the **CL** button.
- g) Finally, press the **TEST / CHK** button.

2. Optional Controller (remote controller)

■ Explanation of alarm messages

Possible cause of malfunction		Alarm message		
Serial communication errors Mis-setting	Remote controller is detecting error signal from indoor unit.	Error in receiving serial communication signal. (Signal from main indoor unit in case of group control) R.C. address on CCU (CR-DYPTG), indoor unit address, indoor unit setting is not set. (Auto address is not completed.)	<E1>	
		Error in transmitting serial communication signal.	<E2>	
	Indoor unit is detecting error signal from remote controller (and system controller).		<<E3>>	
	Indoor unit is detecting error signal from CCU (CR-DYPTG).	Error in receiving serial communication signal. When turning on the power supply, the number of connected indoor units does not correspond to number set. (Except R.C. address is "0")	E4	
		Error in transmitting serial communication signal.	E5	
	CCU (CR-DYPTG) is detecting error signal from indoor unit.	Error in receiving serial communication signal. While turning on power supply, CCU (CR-DYPTG) does not receive serial communication signal from some indoor units.	E6	
		Error in transmitting serial communication signal.	E7	
	Improper setting of indoor unit or remote controller.	Indoor unit address setting is duplicated.	E8	
		Remote controller address (RCU. ADR) switch setting is duplicated. (Duplication of main remote controller)	<<E9>>	
	During auto. address setting, number of connected units does not correspond to number set. When turning on the power supply, number of connected units does not correspond to number set. (Except R.C. address is "0")	Starting auto. address setting is prohibited. Auto address button S001 (A. ADR) is pressed while other R.C. line is executing auto address operation.	E12	
		Error in auto. address setting. (Number of connected indoor units is less than the number set)	E15	
		Error in auto. address setting. (Number of connected indoor units is more than the number set)	E16	
		Error of CCU (CR-DYPTG) in transmitting serial communication signal to outdoor P.C.B..	E23	
		Error of CCU (CR-DYPTG) in receiving serial communication signal from outdoor P.C.B..	E24	
		Duplication of outdoor unit address.	E25	
		The number of connected outdoor unit does not correspond to the number set.	E26	
		Mis-wiring of outdoor unit control wiring	E27	
		Error of outdoor P.C.B. in receiving serial communication signal.	E29	
		Indoor unit communication error of group control wiring.	Error of main indoor unit in receiving serial communication signal from sub indoor units.	E18
Improper setting.	Duplication of main indoor unit address setting in group control.	<L3>		
	Duplication of outdoor R.C. address setting.	L4		
	There are 2 or more remote controllers which has operation mode priority in 1 refrigerant circuit.	Priority setting remote controller	L5	
		Non-priority setting remote controller	L6	
	Group control wiring is connected to individual control indoor unit.	L7		
	Indoor unit address is not set.	L8		
	Capacity code of indoor unit is not set.	<<L9>>		
	Activation of protective device	Protective device in indoor unit is activated.	Thermal protector in indoor unit fan motor is activated.	P1
			Improper wiring connections of ceiling panel.	P9
Float switch is activated.			P10	
Protective device in outdoor unit is activated.		Thermal protector in outdoor unit fan motor is activated. Compressor thermal protector is activated. Defective phase. Power supply voltage is unusual. (The voltage is more than 260 V or less than 160 V between L and N phase.)	P2	
		Abnormal discharge temperature. (PC comp.)	P3	
		High pressure switch is activated.	P4	
		Incorrect power supply voltage. Negative phase.	P5	
		Abnormal discharge temperature. (AC comp.)	P17	
		Abnormal discharge temperature. (SC comp.)	P18	
		Improper setting	Mis-matching setting of refrigerant kinds between CCU and outdoor P.C.B..	L17

NOTE

- Alarm messages in << >> do not affect other indoor unit operations.
- Alarm messages in < > sometimes affect other indoor unit operations depending on the fault.

- CCU : Command control unit (incorporated in outdoor unit)
- PC unit : Power control unit
- AD unit : Additional unit
- PC comp. : Power control compressor
- AC comp. : Constant speed compressor
- SC comp. : Scroll compressor

2. Optional Controller (remote controller)

Possible cause of malfunction			Alarm message
Thermistor fault	Indoor thermistor is either open or damaged.	Indoor coil temp. sensor (Sensor no. 03, TH2)	<<F1>>
		Indoor coil temp. sensor (Sensor no. 04, TH3)	<<F2>>
		Indoor coil temp. sensor (Sensor no. 05, TH4)	<<F3>>
		Indoor suction air (room) temp. sensor (Sensor no. 02, TH1)	<<F10>>
		Indoor discharge air temp. sensor (Sensor no. 06, TH5)	<<F11>>
	Outdoor thermistor is either open or damaged.	PC. comp. discharge gas temp. sensor (Sensor no. 0A, TH1)	F4
		AC. comp. discharge gas temp. sensor (Sensor no. 0b, TH2)	F5

		Lock current is detected.	H12
		Current is not detected when comp. is ON.	H13
		Magnetic contactor (MgSW) is chattering.	H19
	Protective device for SC comp. is activated.	Low pressure switch is activated.	H06
		Overload current is detected.	H21
		Lock current is detected.	H22
		Current is not detected when comp. is ON.	H23
		Improper installation of discharge temp. sensor.	H25
		Magnetic contactor (MgSW) is chattering.	H29
	Low oil level.		H07
	Oli sensor fault.	PC comp. oil sensor	H08
		SC comp. oil sensor	H28

Alarm messages displayed on system controller			
Serial communication errors Mis-setting	Error in transmitting serial communication signal.	Indoor or outdoor unit is not operating correctly. Mis-wiring of control wiring between indoor unit, outdoor unit and system controller.	C05
	Error in receiving serial communication signal.	Indoor or outdoor unit is not operating correctly. Mis-wiring of control wiring between indoor unit, outdoor unit and system controller. CN1 is not connected properly.	C06
Activation of protective device	Protective device of sub indoor unit in group control is activated.	* When using wireless remote controller or system controller, in order to check the alarm message in detail, connect wired remote controller to indoor unit temporarily.	P30

NOTE

- Alarm messages in << >> do not affect other indoor unit operations.
- Alarm messages in < > sometimes affect other indoor unit operations depending on the fault.

- CCU : Command control unit (incorporated in outdoor unit)
- PC unit : Power control unit
- AD unit : Additional unit
- PC comp. : Power control compressor
- AC comp. : Constant speed compressor
- SC comp. : Scroll compressor

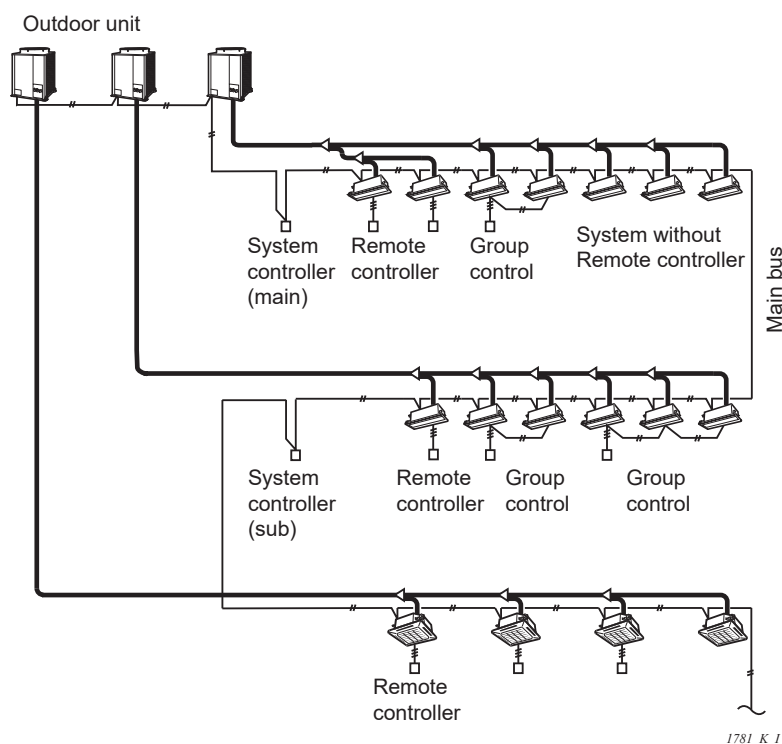

2. Optional Controller (system controller)

2-2. System controller / SHA-KC64TG

- Example of central control with system controller (individually controlled)

Control wiring system

- Control wiring system allows connection of as many as total of 94 units ($64 \geq$ Indoor unit + $30 \geq$ Outdoor unit) to a single control line (non-polar twin-line main bus).
- The main bus is twin-core and non-polar for easier wiring.
- Using concurrently as remote controller, system controller can control maximum up to 64 indoor units (or groups) individually.
- The system without remote controller can be formed.
- Maximum up to 2 system controllers (1 main, 1 sub) can be installed.
- It can separate the 64 indoor units into 4 zones and control each zone individually.
- Maximum up to 16 groups can be registered to each zone.
- Collective control and individual group (unit) control can be performed also.
- Alarm and operation output for an external collected signal is available (potential free contact) DC24V Max. 1A.
- Input terminal for collective operation on / off is available.
- Power supply : AC 220 - 240 V

2. Optional Controller (system controller)

■ How to use the system controller

0198_M J

3

<p>A: ALL / ZONE / GROUP SELECT button</p> <p style="text-align: right; font-size: small;">796_8132</p>	<p>Use this button to select one of the followings:</p> <p>ALL: Used for turning the all air conditioners on and off.</p> <p>ZONE: Used for turning the all air conditioners of each zone on and off individually.</p> <p>GROUP: Used for turing the (all) air conditioner(s) of each group on and off individually.</p> <p>NOTE Max. 4 zones and max. 16 groups (units) in a zone can be set.</p>
<p>B: ZONE select button</p>	<p>Use this button to select zone (1 to 4) to operate individually.</p>
<p>C: GROUP select button</p>	<p>Use this button to select the group (1 to 16) to operate individually.</p>

2. Optional Controller (system controller)

■ Function of buttons (Continued)

D: ON/OFF operation button	This button is for turning the selected air conditioner(s) on and off.						
E: Operation lamp	This lamp lights when the appliance is turned on.						
F: MODE button (AUTO) (HEAT) (DRY) (COOL) (FAN)	Use this button to select one of the following four operations:  : Used to automatically set cooling or heating operation. <div style="border: 1px solid black; padding: 2px; display: inline-block;">Only for single heat pump type</div> (temperature range: 17 - 27 °C)  : Used for normal heating operation. (temperature range: 16 - 26 °C)  : Used for dehumidifying without changing the room temperature. (temperature range: 18 - 30 °C)  : Used for normal cooling operation. (temperature range: 18 - 30 °C)  : Used to run the fan only, without the heating or cooling operation. <div style="border: 1px solid black; padding: 2px; display: inline-block;">NOTE</div> When the MODE FIXED indication is displayed, you can not change the mode,  and  or , to  or  and . You should turn off all units once then select the mode again.						
G: Temperature setting buttons	 : Press this button to increase the set temperature.  : Press this button to decrease the set temperature.						
H: FAN SPEED button (AUTO) (HI.) (MED.) (LO.)	 : The air conditioner automatically decides the fan speed.  : High fan speed  : Medium fan speed  : Low fan speed						
I: FLAP button 	Use this button to set the airflow direction at a specific angle or to make the airflow direction sweep to up and down automatically (SWEEP). Airflow direction or SWEEP indication is displayed on the remote controller. <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th style="text-align: left;">Operation mode</th> <th style="text-align: left;">Number of airflow direction settings</th> </tr> </thead> <tbody> <tr> <td>COOL or DRY</td> <td style="text-align: center;">3</td> </tr> <tr> <td>HEAT or FAN</td> <td style="text-align: center;">5</td> </tr> </tbody> </table> <ul style="list-style-type: none"> ● In the cool mode and dry mode, if the flaps are set in a downward position, condensation may form and drip around the vent. ● Do not move the flap with your hands. <div style="border: 1px solid black; padding: 2px; display: inline-block;">NOTE</div> FLAP setting can be performed only for the unit which has no remote controller.	Operation mode	Number of airflow direction settings	COOL or DRY	3	HEAT or FAN	5
Operation mode	Number of airflow direction settings						
COOL or DRY	3						
HEAT or FAN	5						
J: TEST RUN / CHECK 	This button is used only when servicing the air conditioner. Do not use the TEST / CHK button for normal operation.						

2. Optional Controller (system controller)

<p>K: CENTRAL CONTROL button</p>	<p>Use this button to inhibit individual operation by remote controller for central control as follows:</p> <p>CENTRAL CTRL</p> <p>1 : Inhibiting individual ON / OFF operation</p> <p>2 : Inhibiting individual ON / OFF, MODE and SET TEMP operation.</p> <p>3 : Inhibiting individual MODE and SET TEMP operation.</p> <p>No indication : Central control is cleared. (Individual operation)</p>
<p>L: SET button</p> <p style="text-align: right;">NOTE</p>	<p>This button is used only when installing the air conditioner.</p> <p>Do not use the SET button for normal operation.</p>
<p>M:  CLEAR button</p>	<p>Use this button to reset the filter sign  (timer). The air conditioner has the timer for filter and informs you the time of cleaning the filter.</p>

2. Optional Controller (system controller)

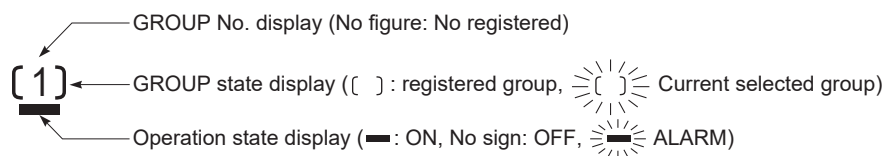

Display

0199_M_1

Description

- A : When the unit is in the heating standby mode, the STANDBY indicator appears.
- B : The currently selected operation mode is displayed.
- C : The currently selected FAN SPEED, fan AIM and SWEEP are displayed.
- D : This is displayed if the period of cleaning for filter has come.
- E : This is displayed only if an abnormality occurs within a unit.
- F : The currently selected mode (ALL, ZONE or GROUP), ZONE No. and Group No. are displayed.

797_8132

- G : The currently selected central control mode (1, 2 or 3) is displayed.
- H : When **CENTRAL CONTROL** is displayed on the LCD, any operation (setting) is made by higher rank controller. When **CENTRAL CONTROL** is flashing on the LCD, ON / OFF operation is not accepted by the higher rank controller (system controller inhibited).
- I : When TEST / CHK button is pressed, the TEST indicator appears.

2. Optional Controller (system controller)

How to start individual operation

Press the SELECT button and select GROUP.	1		To start individual operation
Select the ZONE No. including the group to be operated by pressing ZONE button.	2		Power Keep the power supply switch turned on more than 5 hours before starting operation.
Select the GROUP No. to be operated by pressing GROUP select button ▲▼.	3		5 Set heating, dry, or cooling by pressing the MODE button.
Select the control mode.	9		6 Set the desired temperature by pressing one of the temperature setting buttons ▲▼.
Press the ON / OFF button.	4		7 Set the desired fan speed by pressing the FAN SPEED button.
Confirming the GROUP No. to be selected, once again press the ON/OFF button.	Stop		8 Set the airflow direction at a specific angle or sweep mode

0200_M_1

NOTE FLAP setting can be performed only for the unit which has no remote controller.

3

How to start collective operation

Press the SELECT button and select ALL or ZONE.	1		To start collective operation (ALL or ZONE)
In case of ZONE collective operation.			Power Keep the power supply switch turned on more than 5 hours before starting operation.
Select the ZONE No. to be operated by pressing ZONE button.	2		4 Set heating, dry, or cooling by pressing the MODE button.
Select the control mode.	7		5 Set the desired temperature by pressing one of the temperature setting buttons ▲▼.
Press the ON / OFF button.	3		6 Set the desired fan speed by pressing the FAN SPEED button.
Confirming the ZONE No. to be selected or ALL indication, once again press the ON/OFF button.	Stop		

0201_M_1

NOTE In the ALL or ZONE mode, FLAP setting can not be performed. If necessary you should select GR mode and use FLAP button.

2. Optional Controller (system controller)

■ How to install the system controller

Installation site selection

- Install the system controller at a height of between 1 and 1.5 meters above the floor.
- Do not install the system controller in a place where it will be exposed to direct sunlight or near a window or other place where it will be exposed to the outside air.
- Be sure to install the system controller vertically, such as on a wall.

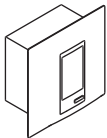

WARNING

Do not supply power to the unit or try to operate it until the tubing and wiring to the outdoor unit is completed.

CAUTION

- Do not twist the control wiring with the power wiring or run it in the same metal conduit, because this may cause malfunction.
- Install the system controller away from sources of electrical noise.
- Install a noise filter or take other appropriate action if electrical noise affects the power supply circuit of the unit.

Part Name	Figure	Q'ty	Remarks
System controller		1	
Tapping screw	Truss-head Phillips 4 × 16 mm 	4	For securing the system controller
Rawl plug		4	For securing the system controller
Manual		1	For installation
		1	For operation

2. Optional Controller (system controller)

● Diagram of outer dimensions

Z-view (black side)

* In order to mount the system controller flush with the wall, an opening measuring 128 mm × 128 mm is necessary.

2. Optional Controller (system controller)

● Installation procedure

0217_M_1

1. Decide how the system controller will be mounted: in the normal manner or flush with the wall.
 - a) To mount the system controller in the normal manner, remove the mounting plate. Then reattach the four screws to the electrical component box.
 - b) To mount the system controller flush with the wall, make an opening in the wall measuring 128 mm × 128 mm. The opening must be at least 85 mm deep as measured from the outside surface of the wall.
2. Remove the rear plate and connect the electrical wiring.
 - 1) Remove the four screws located on both sides of the rear plate.
 - 2) Either the hole in the top of the electrical component box or the hole in the rear plate may be used to feed the electrical wiring.
 - 3) If the hole on top is used, the rear plate should be turned upside down.
3. Secure the system controller in place.
 - a) If the system controller is being mounted in the normal manner, first attach the rear plate to the wall using the screws and Rawl plugs provided. Next, place the body of the system controller over the rear plate and secure it in place using four screws.
 - b) If the system controller is being mounted flush with the wall, fit it through the mounting plate on the wall and secure it in place using the screws and Rawl plugs provided.

0218_M_1

NOTE

To mount the system controller on a wall made of cinder block, brick, concrete, or a similar material, drill 4.8 mm diameter holes in the wall and insert Rawl plugs to anchor the mounting screws.

2. Optional Controller (system controller)

■ Layout of electrical terminals

1789_M_1

How to connect electrical wiring

1) Basic wiring

L (L1): } Power supply (\sim 50 Hz / 60 Hz, 220 - 240 V)
 N (L2): }

C1: } Inter-unit control wiring. (Low voltage)
 C2: }

C3: Auxiliary

C4: Ground for inter-unit control wiring

2) Terminals for remote monitoring

A1: Input for turning on air conditioners concurrently. (*1) }
 A2: Input for turning off air conditioners concurrently. } DC24V
 A3: Common input for turning air conditioners on or off. }

B1: On operation state indicator output. (*2) }
 B2: Alarm indicator output. (*3) } potential free contact
 B3: Common indicator output. } DC24V, Max 1A

NOTE

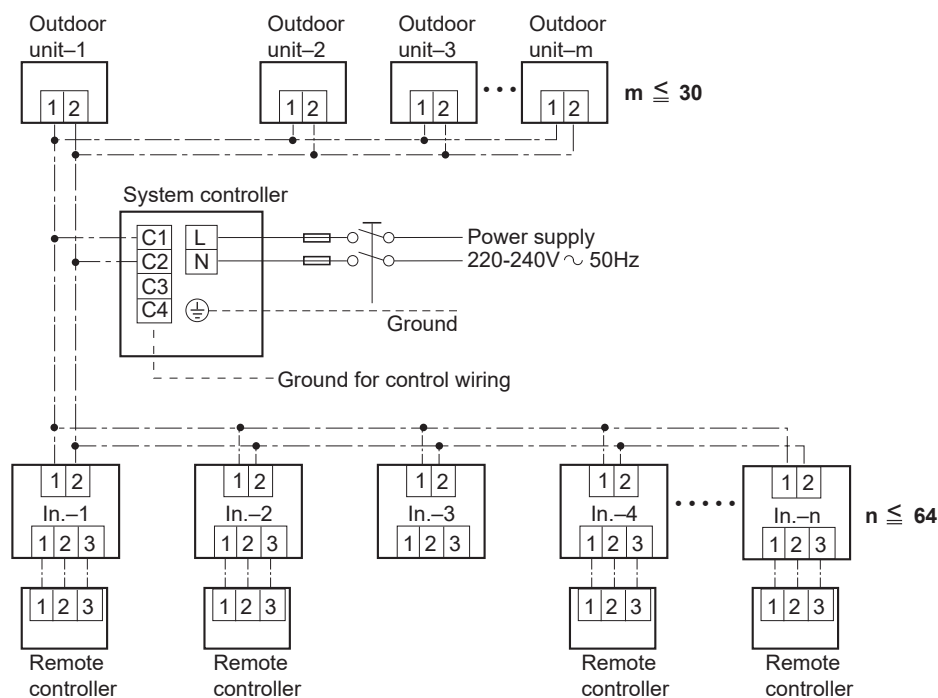

- 1) *1: All air conditioners turn on at same mode and operation conditions of when it stops as before.
- 2) *2: The output signal will appear when any one of indoor units turns on.
- 3) *3: The alarm signal will appear when any one of indoor units has a trouble.

2. Optional Controller (system controller)

■ Basic wiring diagram

CAUTION

Make correct wiring without any mistakes (incorrect wiring will damage the equipment).

0202_M_1

3

NOTE

- 1) The chain lines (— — —) indicate control line in the system.
- 2) In. means indoor unit.
- 3) Up to two system controllers are connectable in one control line system.
- 4) Recommended wire diameter and wire length

Type	Power supply	Time delay fuse or circuit capacity	Power supply terminal base	
	2.5 mm ²		Capacity	Max. wire diameter
System controller	Max. 100 m	10 A	25 A	5.5 mm ² (AWG #10)*

* With ring type wire terminal.

Control wiring (Use shield wiring)

Inter-unit control wiring	Remote control wiring
0.75 mm ² (AWG #18)	0.75 mm ² (AWG #18)
Use shielded wiring*	
Max. 1,000 m (Total)	Max. 500 m (Total)

2. Optional Controller (system controller)

■ Control with multi (main / sub) system controllers

This control is used for operating the unit(s) with multiple system controllers (up to two).

P.C. board of the control unit

0220_M_I

NOTE

1. It is not normally necessary to change the settings.
2. All bits are set to OFF when the unit is shipped from the factory.

Setting method

To execute this control, make the setting according to the following procedure.

1. Out of the multiple installed system controllers, make one the main system controller (factory shipped state).
2. For the other system controller, turn the Bit number 1 of address switch on the PC board from OFF to ON.
In this state, the unit functions as the sub system controller.

How to reach P.C. board

Remove the flap-top screw on the bottom of the back case. When you open up the decorative cover, you will see two notches under the control unit. Insert a coin or other flat object into these notches and pry off the back case. The P.C. board on the back of the control unit is now visible.

0158_M_I

3

2. Optional Controller (system controller)

■ How to set zone registration

To operate system controller properly, zone registration is required after finishing test run (after setting all indoor unit addresses) as following methods.

- (1) Zone registration by remote controller (RCS-SH80TG)
- (2) Zone registration by system controller (SHA-KC64TG)
- (3) Auto. zone registration by system controller (SHA-KC64TG)

In case of method (1) and (2), you should make the zone registration table manually in advance the above registration as shown by next page.

In case of method (3), zone registration is executed automatically assigning from small indoor unit address and small central address to large No. in numerical order. For example,

Central address	1	2	3	4	5	6	
(ZONE-GROUP)	1-1	1-2	1-3	1-4	1-5	1-6	
Indoor unit address	1-1	1-2	2-1	2-2	2-3	3-1	

NOTE

1. Indoor unit address is assigned to each indoor unit after auto. address operation. Indoor unit address is combined R.C. address and indoor unit No. as follows:

1-1 : Indoor unit address (UNIT No.)
 ↑ Indoor unit No.
 — Refrigerant circuit No. (R.C. address)

799_8132

This address is displayed on remote controller for UNIT No. when pressing UNIT button.

2. Central address represents each zone and group No. in numerical order.

2. Optional Controller (system controller)

ZONE registration table

ZONE	GROUP	Central address	Indoor unit address (UNIT No.)	Unit location	ZONE	GROUP	Central address	Indoor unit address (UNIT No.)	Unit location
1	1	1			3	1	33		
	2	2				2	34		
	3	3				3	35		
	4	4				4	36		
	5	5				5	37		
	6	6				6	38		
	7	7				7	39		
	8	8				8	40		
	9	9				9	41		
	10	10				10	42		
	11	11				11	43		
	12	12				12	44		
	13	13				13	45		
	14	14				14	46		
	15	15				15	47		
	16	16				16	48		
2	1	17			4	1	49		
	2	18				2	50		
	3	19				3	51		
	4	20				4	52		
	5	21				5	53		
	6	22				6	54		
	7	23				7	55		
	8	24				8	56		
	9	25				9	57		
	10	26				10	58		
	11	27				11	59		
	12	28				12	60		
	13	29				13	61		
	14	30				14	62		
	15	31				15	63		
	16	32				16	64		

NOTE

1. You should assign each indoor unit address to the desired position (Central address) manually.
2. In case of group control, only main indoor unit should be assigned. Sub indoor unit can not be assigned.

2. Optional Controller (system controller)

(1) Zone registration by remote controller (RCS-SH80TG)

- ❑ In this case confirming the indoor unit connected with the remote controller, you set the central address one by one.
- ❑ In case of remote controller-less system, connect remote controller to the system temporarily then follow this procedure.

NOTE Indoor unit address must have been already set before performing the zone registration. If necessary you can refer to the installation manual attached in the outdoor unit.

- a) Press the **TEST / CHK** button at the bottom right on the remote controller for more than 4 seconds.
- b) Once in this mode, the UNIT No., CODE No., SET DATA and **SETTING** will flash on the display as shown below.

NOTE In case of group control, "ALL" instead of UNIT No. will flash on the display. Select the main indoor unit address by pressing the **UNIT** button once.

- c) Set the CODE No. 03 with ▲, ▼ (**SET TEMP**) button.

NOTE The CODE No.03 must be selected to perform the zone registration by the remote controller.

2. Optional Controller (system controller)

- d Set the central address which you want to set to this indoor unit address with ▲, ▼ (⊖) button according to the zone registration table

For example, in case of left

Indoor unit address : 1-8

Central address : 17 (ZONE 2, GROUP 1)

- e Press the **SET** button. The CODE No. and Central address changes from flashing to ON state. If you make mistake, then press the **CL** button and re-set the central address.

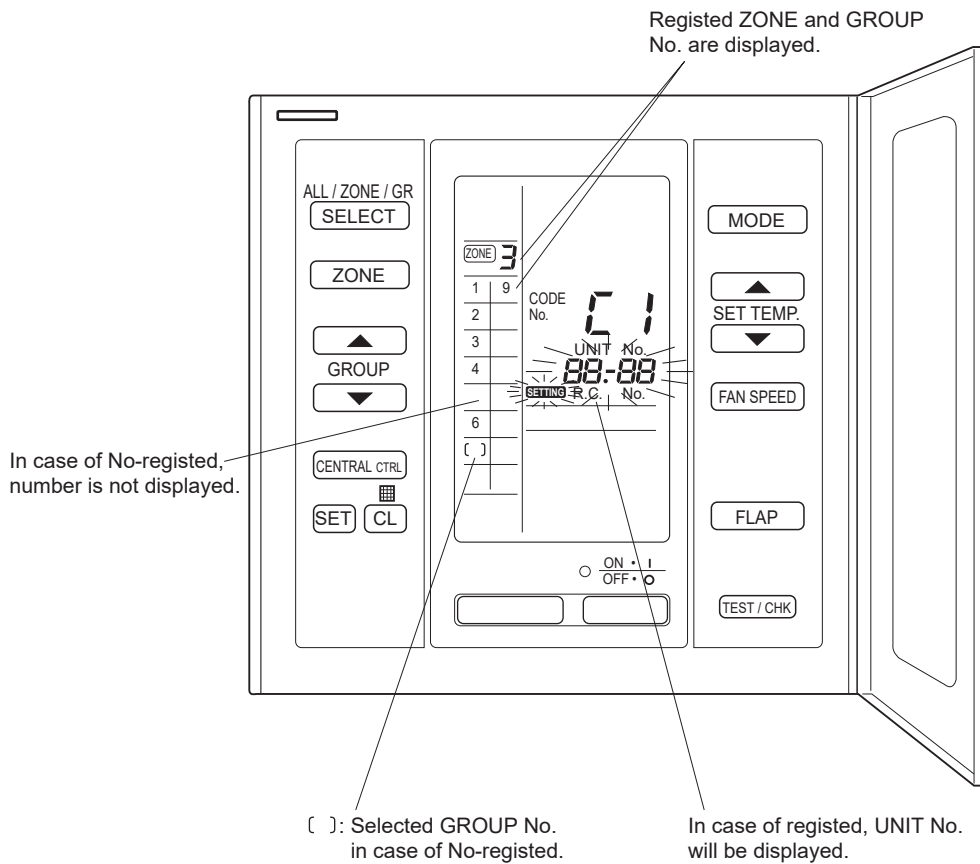

- f Press the **TEST / CHK** button to finish zone registration.

2. Optional Controller (system controller)

(2) Zone registration by system controller

- In this case you set all central addresses by system controller at once manually.
- ① Press the **TEST / CHK** and **ZONE** buttons at the same time for more than 4 seconds.
SETTING and CODE No. C1 will flash.
- ② After confirming code No. C1, press the SET button.
Once in this mode, a change takes place as shown below.

2. Optional Controller (system controller)

- Ⓒ Select the zone and group No. which you want to set with **ZONE** and ▲, ▼ (**GROUP**) buttons.
- Ⓓ Set the UNIT No. (Indoor unit address) with **FAN SPEED** and **FLAP** buttons according to the zone registration table.

R.C. No. ——— **FAN SPEED** button

Indoor unit No. — **FLAP** button

- Ⓔ Press the **SET** button.
GROUP No. turns ON and UNIT No. (Indoor unit address) changes from flashing to ON state.
UNIT No. is registered to selected ZONE No. and GROUP No..

If you make mistake, then press the **CL** button and re-select the ZONE, GROUP and UNIT No.

For example, in case of left

Zone 3, GROUP No. 7

UNIT No. (Indoor unit address) 2-8

: UNIT No. 2-8 is registered to
Zone 3-GROUP 7.

3

- Ⓕ Register the other UNIT No. in the same way by following the above steps Ⓒ to Ⓔ.
- Ⓖ Finally, complete the registration by pressing the **TEST / CHK** button. **SETTING** changes from flashing to OFF state.

2. Optional Controller (system controller)

(3) Auto. zone registration by system controller

- a Press the **TEST / CHK** and **ZONE** buttons at the same time for more than 4 seconds.
SETTING and CODE No. C1 will flash.
- b Select CODE No. C2 by pressing ▲ , ▼ (**SET TEMP**) button and press the **SET** button.
C2 changes from flashing to ON state and auto. zone registration will start.
- c Registered GROUP No. will be disappeared all.
- d Central address will be assigned from small indoor unit address to large one in numerical order automatically.
Finishing auto. zone registration, **SETTING** changes from flashing to OFF.
- e If the error is happened, the "CHECK" starts flashing and zone registration finishes at this time. Press the **CL** button.
- f Finally, complete the auto. zone registration mode by pressing the **TEST / CHK** button.

0204_M_1

2. Optional Controller (system controller)

■ How to check overlapping of central address No.

- a) Press the **TEST / CHK** and **ZONE** buttons at the same time for more than 4 seconds.
SETTING and CODE No. C1 will flash.
- b) Select CODE No. C3 by pressing **▲** , **▼** (**SET TEMP**) button and press the **SET** button.
C3 changes from flashing to ON state and **SETTING** will flash. Then auto. overlap checking will start.
- c) If C3 changes from ON to flashing and **SETTING** changes from flashing to ON, there is no overlapping. Then finally, complete the auto. overlap checking mode by pressing the **TEST / CHK** button.
- d) If some of GROUP No., ZONE No. and UNIT No. flash, you should try again the zone registration.
 - ① Select CODE No. C1 by pressing **▲** , **▼** (**SET TEMP**) button and press the **SET** button.
 - ② Select the flashing GROUP No. with **ZONE** and **GROUP** button.
Then press the **CL** button and re-select the **ZONE**, **GROUP** and **UNIT** No.
 - ③ Then finally, complete the auto. overlap checking mode by pressing the **TEST / CHK** button.

0205_M_1

2. Optional Controller (weekly timer)

2-3. Weekly timer / TM-WBGN

- The weekly timer is used, connected to remote controller (RCS-SH80TG), and system controller (SHA-KC64TG).
- ON / OFF can be easily set 3 times a day, in units of 1 minutes, in conversation mode. Program reservation of 1 week can be also easily set.
- Operation reservation can be temporarily cancelled using “cancel button” without changing the program.
- The 24-hour display shows the current time, day, and the details of operation during program execution.
- The output can be forcibly turned ON, without changing the program.
- A built-in back up function memorizes the program reservation, providing back up against power failure.

● System diagram

683_8132

● Diagram of outer dimensions

1780_M_1

2. Optional Controller (weekly timer)

■ How to use the weekly timer

1036_1143

2. Optional Controller (weekly timer)

(A) Setting the current time

- Set the current time. (Ex: When the current time is 11 hrs. 45 min.)
- ① Holding the SET button pressed, press the HH. button and adjust the current time.

- When the HH. button is pressed every time while holding the SET button pressed, the hour is successively counted.
0 → 1 → ... → 10 → ... → 23 → 0
- When the HH. button is held pressed while holding the SET button pressed, the hour is fast fed.
(Ex: To set the hour at 11 hours, release the button at 11).
- When the SET button is released, the hour is set and it changes from flashing to ON.

- ② Holding the SET button pressed, press the MM. button and adjust the current time.

- When the MM. button is pressed every time while holding the SET button pressed, the minute is successively counted.
00 → 01 → ... → 58 → 59 → 00
- When the MM. button is held pressed while holding the SET button pressed, the minute is fast fed.
(Ex: To set the minute at 45 minutes, release the button at 45).
- When the SET button is released, the minute is set and it changes from flashing to ON.

NOTE

- The time cannot be changed by pressing only the HH. and MM. buttons.
- If the DAY, HH., or MM. button is not pressed while it is flashing, the original display (regular display) is automatically restored after lapse of 30 seconds. Repeat the operation from the beginning.

(B) Setting the day

- Set today's day. (Ex: On Wednesday)
- ① Holding the SET button pressed, press the DAY button and adjust the today's day.

- When the DAY button is pressed while holding the SET button pressed, the current day display "∞" starts flashing and the day successively changes as follows.

▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...▽...
Su Mo Tu We Th Fr Sa
1009_1143

The day is set as soon as the SET button is released, and it changes from flashing to ON.

NOTE

- The day cannot be changed by pressing only the DAY button.
- If the DAY, HH., or MM. button is not pressed while it is flashing, the original display (regular display) is automatically restored after lapse of 30 seconds. Repeat the operation from the beginning.

(C) Setting program operation

The program operation can be set up to 3 cycles per day (only 1 or 2 cycles can be also set).

The following points can be set in program operation.

- Setting the ON → OFF times (ON only cannot be set).

Display of program operation, and its names

Ex: To set the program operation of Monday at the following times.

From 8:00 to 12:00
From 12:40 to 16:50
From 17:00 to 19:00

2. Optional Controller (weekly timer)

- ① At first, press the program button.

- The operation reservation display “**—**” starts flashing as soon as the program button is pressed.

- ② Select the day of program operation by pressing the DAY button, and press the SET button.

The reservation operation display “**—**” changes from flashing to ON state as soon as the SET button is pressed, and the ON time of program 1 starts flashing at the same time.

- ③ Set the ON time by pressing the HH. and MM. buttons, and press SET button.

As soon as the SET button is pressed, the ON time (8:00 in the example) changes from flashing to ON state, and at the same time the OFF time of program 1 starts flashing.

- ④ Set the OFF time by pressing the HH. and MM. buttons, and press SET button.

As soon as the SET button is pressed, the OFF time (12:00 in the example) changes from flashing to ON state, and at the same time the ON time of program 2 starts flashing.

- ⑤ Next, set the operating times of programs 2 and 3.

As soon as the SET button is pressed after setting the OFF time of program 3, the OFF time (19:00 in the example) changes from flashing to ON state, and at the same time the ON time of program 1 starts flashing.

2. Optional Controller (weekly timer)

- ⑥ Finally, press the PROGRAM button.
After setting, press the PROGRAM button within the next 30 seconds.

This completes the setting of program operation on 1 day (Monday, in the example). The ON / OFF display appears, if the current time is within the set times. (In this state, the ON / OFF times of program 1 are displayed, because the current time is within the set times.

- ⑦ Set the program operation of other day in the same way by following the above steps ① to ⑥. At this time, if the day's operating time is the same as that of already set another day, refer to the item "Copying the Program Operating Time".

NOTE

- Setting of program time
0:00 is treated as 24:00.
Ex : Following program time can be set.

- If the DAY, HH., or MM. button is not pressed while it is flashing, the original display (regular display) is automatically restored after lapse of 30 seconds. Repeat the operation from the beginning.

(D) Set error

If the "ERROR" starts flashing at the time of setting program operation, correct the time in the following way.

- ① When the "ERROR" starts flashing, the ON time of error generated program also starts flashing.

- ② Press the SET button, and make the time to be corrected flashing.
- ③ Revise the ON / OFF time using the HH. and MM. buttons.
- ④ Press the SET button.
If the time is correctly set, the error display disappears.
- ⑤ Complete the revision by pressing the PROGRAM button.

2. Optional Controller (weekly timer)

NOTE

- "ERROR" is displayed, if the ON / OFF times are set as follows.

(1) If the operating times overlap

Ex: ON OFF
 8:00 ▶ 12:00
 11:00 ▶ 14:00
1050_1143

(2) If the OFF time is earlier than the ON time

Ex: ON OFF
 12:00 ▶ 8:00
1051_1143

(3) If the ON and OFF times are the same

Ex: ON OFF
 8:00 ▶ 8:00
1052_1143

(4) If only the ON or OFF time is set

Ex: ON OFF
 8:00 ▶ Not set
1053_1143

- Set error is not generated in the following cases

(1) If the OFF time of previous cycle and the ON time of next cycle are the same

Ex: ON OFF
 8:00 ▶ 12:00
 12:00 ▶ 19:00
1054_1143

(2) If the time band of next cycle is earlier than that of the previous cycle

Ex:

ON OFF As soon as PROGRAM button is pressed, the time bands becomes rearranged in the early order. ON OFF
 12:40 ▶ 16:50 8:00 ▶ 12:00
 8:00 ▶ 12:00 12:40 ▶ 16:50
1055_1143

(3) If both the ON and OFF times are 0:00

Ex:

ON OFF The air conditioner will enter the 24-hour-continuous operation mode.
 0:00 ▶ 0:00
1056_1143

2. Optional Controller (weekly timer)

(E) Copying the program operating time

At the time of setting program operation, if the operating time to be set is the same as that an already set another day, it can be copied here.

Ex: To copy the operation of Monday at the operation of Tuesday

- ① Press CHECK button while in the state of regular display.
- ② Press DAY button, and bring the operation reservation indicator “■” at the day (Mon. in the example) whose program operation has been already set.
- ③ Press the PROGRAM button.

Current day indicator “∞” and operation reservation indicator “■” start flashing.

- ④ Press DAY button, and bring the operation reservation indicator “∞” at the day (Tue. in the example) whose program operation is to be set. (To copy continuously, press the SET button, then press the DAY button, and repeat the process).
- ⑤ Press the PROGRAM button. The operation reservation indicator “■” turns ON below the copied day.

(F) Checking the program operating time

- ① Press CHECK button.

Ex:
To check the program operating times of Wednesday, on Monday

- The operation reservation indicator “■” starts flashing, beginning from the state of regular display.

- ② Press DAY button, and bring the operation reservation indicator “■” at the day to be checked.

- Every time the DAY button is pressed, the operation reservation indicator “■” starts flashing, and the operation times of the day where the operation reservation indicator “■” is located are displayed.

- ③ Press CHECK button. Regular display is restored.

NOTE

1. If a button other than the DAY, CHECK, and PROGRAM is pressed while checking, the display does not change.
2. While checking, if 30 seconds elapse without pressing of the DAY, CHECK, or PROGRAM button, regular display is automatically restored.

(G) Changing the program operating time

- ① Beginning from regular display, press the PROGRAM button.
- ② Press DAY button, and bring the operation reservation indicator “■” at the day to be revised.
- ③ Press SET button.
- ④ Pressing SET repeatedly moves the flashing position in the following order. Adjust it at the time to be changed.

- ⑤ Change the time with the HH. and MM. buttons.
- ⑥ Press SET button.
- ⑦ Finally, complete the revision by pressing the PROGRAM button.

2. Optional Controller (weekly timer)

(H) Clearing a program operation

- Clearing the program of the day

- ① Press PROGRAM button.
- ② Press DAY button and bring the operation reservation indicator "I" at the day to be cleared.
- ③ Press CLEAR button. The program times disappear.
- ④ Press PROGRAM button. The operation reservation indicator "I" disappears.

- Clearing a part of the program

- ① Press PROGRAM button.
- ② Press DAY button and bring the operation reservation indicator "I" at the day whose part of the program is to be cleared.
- ③ Press SET button.
- ④ Press SET button once again, and make the ON or OFF time of the program to be cleared flash.
- ⑤ Press CLEAR button. Part of the program disappears, and at the same time the remaining programs automatically get rearranged.
- ⑥ Press PROGRAM button.

(I) Cancelling the temporary program operation

- Operation reservation in unit of days can be temporarily cancelled, using CANCEL button.

- ① Press the CANCEL button. The cancel set indicator "I" starts flashing.
- ② Press the DAY button, and bring the cancel set indicator "I" at the day which is to be set as a cancel day.
- ③ Press SET button. The cancel set indicator "I" changes from flashing to ON state (I).

- Cancelling a set cancel day

- ① Press the CANCEL button.
- ② Press the DAY button, and bring the cancel set indicator "I" at the day which is to be cancelled as a cancel day.
- ③ Press SET button. The cancel set indicator "I" disappears, and the display changes over to operation reservation display (I).

- Description of operation

The operation is temporarily cancelled on the day which is set as a cancel day, but on the following day the cancel set indicator "I" disappears automatically and operation reservation indicator "I" is restored.

NOTE

- The day for which no program has been set cannot be set as a cancel day.

2. Optional Controller (weekly timer)

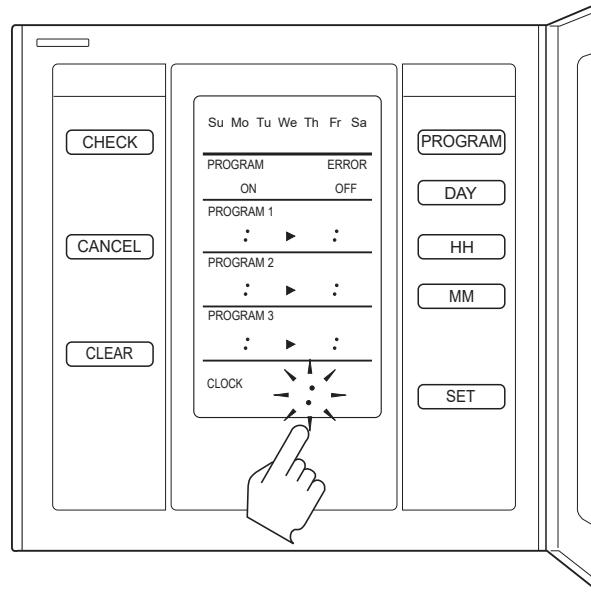

(J) Others

Some information on this weekly timer

1. Power Failure

If a power failure occurs during operation, and the power supply is later recovered, the display appears as shown on the right.

(The colon “ : ” of current time flash).

10 65_1143

- Restarting operation

① Start the air conditioner with remote controller.

② Press the PROGRAM button of weekly timer.

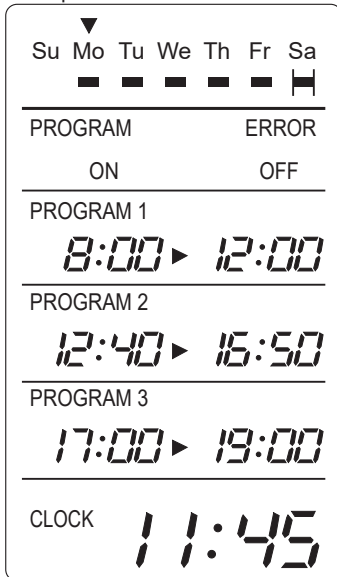

The colon of current time changes from flashing to ON state, and regular status is restored.

In this case the set program operation is kept memorized by the back up function, so it need not be set again.

2. Operations of the weekly timer and air conditioner

The air conditioner fitted with a weekly timer is operated with either a remote controller or with a weekly timer.

Example

1066_1143

① Operation pattern of 1 day (static signal)

1067_1143

1068_1143

2. Optional Controller (weekly timer)

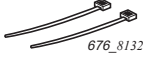

■ How to install the weekly timer

WARNING

Do not supply power to the unit or try to operate it until the tubing and wiring to the outdoor unit is completed.

■ Accessories

No.	Accompanying parts	Q'ty	No.	Accompanying parts	Q'ty
①	Weekly timer  651_8132	1	⑤	Spacer  654_8132	2
②	Connecting wiring length 1.2 m  728_8132	2	⑥	Clampers  676_8132	2
③	Screws M4 × 25  652_8132	2	⑦	Operation manual  657_8132	1
④	Wooden screws  653_8132	2	⑧	Installation manual  657_8132	1

CAUTION

- Do not twist the control wiring with the power wiring or run it in the same metal conduit, because this may cause malfunction.
- Install the weekly timer away from sources of electrical noise.
- Install a noise filter or take other appropriate action if electrical noise affects the power supply circuit of the unit.

The mounting position for the weekly timer should be located in an accessible place for control. Never cover over the weekly timer or recess it into the wall.

- (1) Remove the flat-top screw on the bottom of the back case. When you open up the decorative cover, you will see two gaps under the weekly timer. Insert a coin into these gaps and remove the back case.

When using a wall box for flush mounting

- If local codes allow, this weekly timer can be mounted using a conventional wall box for flush mounting.
- (2) Attach the back case with the 2 small screws provided. Using a screwdriver, push open the cut-outs on the back case. These holes are for screws. Use the spacers and take care not to tighten the screws excessively. If the back case does not sit well, cut the spacers to a suitable thickness.
 - (3) Connect the 4 wires to the weekly timer 4P terminal base. (see next page)
 - (4) To finish, fit the back tabs of the back case into the weekly timer and mount it using the flat-top screw.

Mounting dimensions for continuous installation

- For vertical continuous installation, the space between the weekly timer and the remote controller must be 25 mm or more.

2. Optional Controller (weekly timer)

■ Wiring diagram (for wiring, always use the supplied wires)

● Layout

The weekly timer and remote controller may be located, either one on the left or right sides.

● Wiring procedure

Do the wiring according to the following procedure.

- Loosen the retaining screw of the lead wire of the weekly timer, remove the collar, and connect the to the timer terminal (4P connector) of weekly timer. Place the supplied connection wiring into the groove neatly, and then refasten the collar.

- Pass the supplied connection wiring through the lead-wire drawing-out port on the bottom case of weekly timer, then run it behind the wall, and connect it to the timer terminal (4P terminal) of the remote controller. (Use the supplied collar for fastening the wiring of remote controller).

■ Test run setting

- After installation, check the output state of the weekly timer with the "FORCED OPR." switch (OFF to ON) located on the rear side of its PCB. After confirming normal operation, turn the "FORCED OPR." switch back to OFF without fail.

■ Memory back up function for power failure compensation

- This weekly timer keeps the settings of operating buttons memorized; so that after a power failure the operation can be restarted in the same set state by pressing the PROGRAM button.
- Using the "Back Up" After installation, confirm that the BAT.BKUP switch on the rear side of the weekly timer's PCB is ON.

■ Display at power ON

- When the power is turned ON, the weekly timer displays the following.

At power ON

After 5 sec.

2. Optional Controller (simplified remote controller)

2-4. Simplified remote controller / RCS-KR1TG

■ How to use the simplified remote controller

1504_T_1

A:	ON/OFF operation button	This button is for turning the air conditioner on and off.
B:	MODE button	Use this button to select one of the following five operating modes.
	(AUTO)	 : Used to automatically set cooling or heating operation. Only for single heat pump type (temperature range: 17 - 27 °C)
	(HEAT)	 : Used for normal heating operation. Only for heat pump type (temperature range: 16 - 26 °C)
	(DRY)	 : Used for dehumidifying without changing the room temperature. (temperature range: 18 - 30 °C)
	(COOL)	 : Used for normal cooling operation. (temperature range: 18 - 30 °C)
	(FAN)	 : Used to run the fan only, without the heating or cooling operation.
C:	Temperature setting buttons	 : Press this button to increase the temperature setting.  : Press this button to decrease the temperature setting.

2. Optional Controller (simplified remote controller)

<p>D: FAN SPEED selector button</p> <p>(AUTO)  : The air conditioner automatically decides the fan speed. (HI.)  : High fan speed (MED.)  : Medium fan speed (LO.)  : Low fan speed</p>	
<p>E: FLAP button</p> <p style="text-align: right;">NOTE</p>	<p>1. Use this button to set the airflow direction to a specific angle.</p> <ul style="list-style-type: none"> ● In the cool mode and dry mode, if the flaps are set in a downward position, condensation may form and drip around the vent. ● Do not move the flap with your hands. <p>This function is available only for models X, S, SL, T and K.</p>
<p>F: * Temperature sensor (Internal)</p>	<p>Although the temperature sensor in the indoor unit normally detects the temperature, this internal sensor can detect the temperature around the remote control unit. For more information, contact the dealer where you made the purchase. (Do not make any settings if group control is being used.)</p>
<p>G: Test button</p> <p> CAUTION</p>	<p>This button is used only when servicing the air conditioner. Do not use the TEST button for normal operation.</p>

NOTE When two remote control units are being used in one group control* system, the most recent button that is pressed on any remote control unit is effective.

* Group control means that maximum up to 8 indoor units can be concurrently controlled with a remote controller.

* **Switching the room temperature sensor**

The room temperature sensor is placed both in the indoor unit and the simplified remote controller respectively. Either sensor can be used to sense the room temperature.

The indoor unit sensor is usually used.

If you use the simplified remote controller to sense the room temperature, switch the remote controller sensor switch (RCU. SNS) on the P.C. board of the simplified remote controller from OFF to ON. See the diagram below.

< **NOTE 1** > Although switching the simplified sub-remote controller's switch from OFF to ON, the sub-remote controller cannot detect the room temperature.

< **NOTE 2** > The standard remote controller cannot detect the room temperature.

1791_M_I

2. Optional Controller (simplified remote controller)

Display (Remote controller)

1505_T_1

Description

- A** : This is displayed to indicate that the system controller is being used for control.
When **CENTRAL CTRL** is flashing on the display, the operation is not accepted by the system controller.
- B** : When the unit is in the heating standby mode, the STANDBY indicator appears.
- C** : This displays the temperature setting.
- D** : This displays alarm messages when an error occurs.
- E** : This is displayed when using the temperature sensor in the remote control unit.
- F** : This is displayed only if an abnormality occurs within a unit.
- G** : The currently selected FAN SPEED is displayed.
- H** : When the TEST button is pressed, the TEST indicator appears.
- I** : The currently selected operation mode is displayed.

2. Optional Controller (simplified remote controller)

■ How to install the simplified remote controller

WARNING

Do not supply power to the unit or try to operate it until the tubing and wiring to the outdoor unit is completed.

■ Accessories

No.	Accompanying parts	Q'ty	No.	Accompanying parts	Q'ty
①	Simplified remote controller (comes with 200 mm wire)		④	Spacers	2
②	Machine screws M4 × 25	2	⑤	Wire joints	3
③	Wood screws	2	⑥	Installation manual	1

CAUTION

- Do not twist the control wiring with the power wiring or run it in the same metal conduit, because this may cause malfunction.
- Install the simplified remote controller away from sources of electrical noise.
- Install a noise filter or take other appropriate action if electrical noise affects the power supply circuit of the unit.

The mounting position for the simplified remote controller should be located in an accessible place for control. Never cover over the simplified remote controller or recess it into the wall.

- (1) Insert a screwdriver or the like in the groove on the lower side of the simplified remote controller body to pry off the back case.

When using a wall box for flush mounting

- If local codes allow, this weekly timer can be mounted using a conventional wall box for flush mounting.
- (2) Use the two supplied M4 machine screws to secure the simplified remote controller back case. Prior to mounting, clear the cutouts in the back case corresponding to the holes in the wall box using a screwdriver or the like. Use the spacers and take care not to tighten the screws excessively. If the back case will not seat well, cut the spacers to a suitable thickness.
 - (3) Connect locally supplied three core lead wires to the lead wires from the simplified remote controller. (See "How to wire the simplified remote controller.")

When connecting the locally supplied three core lead wires to the terminal block, check the terminal numbers in the indoor unit to make sure that the wires are correctly connected. (The simplified remote controller is damaged if 220 / 240 V AC is applied.)

- (4) Fit the simplified remote controller to the tabs of the back case and mount it screw.

1506_T_1

1507_T_1

Mounting dimensions for continuous installation

1510_T_1

Place of installation

- Mount the simplified remote controller at a height of 1 to 1.5 meters above the floor where it can sense the average temperature of the room.
- Do not mount the simplified remote controller in a place exposed to direct sunlight or a place exposed to outside air such as near a window.
- Do not mount the simplified remote controller behind an object so that it is separated from the air circulation of the room.
- Mount the simplified remote controller in a room air conditioned.
- The simplified remote controller must be mounted on the wall or other surface vertically.

2. Optional Controller (simplified remote controller)

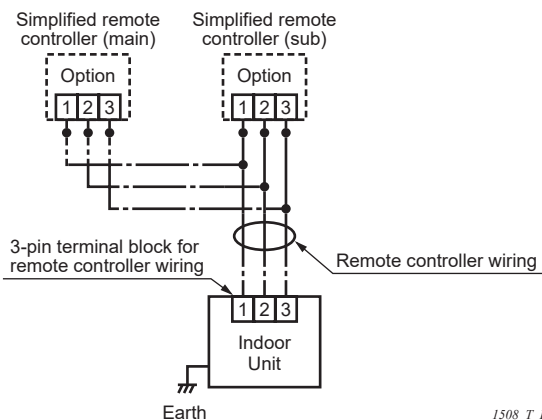

■ Basic wiring diagram

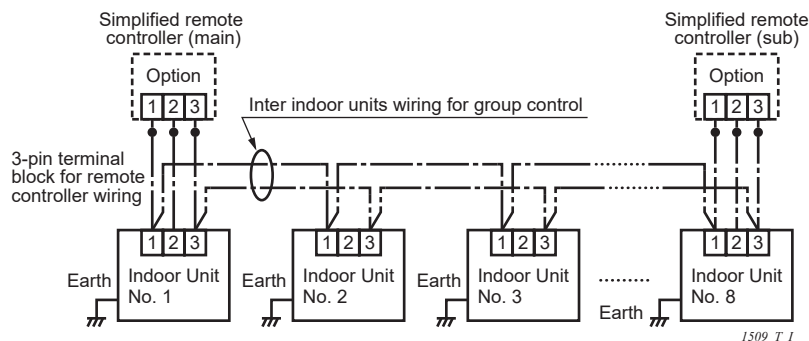

CAUTION

Make correct wiring without any mistakes (incorrect wiring will damage the equipment).

- Following is a wiring diagram for controlling one indoor unit by two simplified remote controllers.

- Performing the group control of the multiple indoor units with two simplified remote controllers.
- * The main and the sub simplified remote controllers can be installed at any indoor unit for operations.

NOTE

- 1) The chain lines (— — —) indicate control line in the system.
- 2) Up to two system controllers are connectable in one control line system.
- 3) Recommended wire diameter and wire length

Remote control wiring	Control wiring for group control
0.75 mm ² (AWG #18)	0.75 mm ² (AWG #18)
Max. 500 m (Total)	Max. 500 m (Total)

2. Optional

2-5. Indoor-use Relay Board / ACC-DC24SB

Used for centralized control over various air conditioner operations from a remote location.

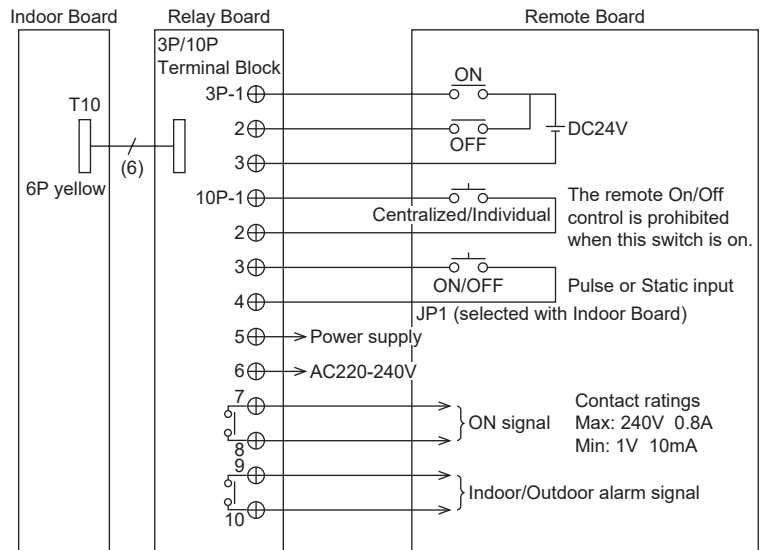

Can be connected to all ECO indoor units.

Input

- Three-way On/Off selection
 - Individual On/Off pulse signals (DC24V pulse signal)
 - On/Off pulse signal (potential free pulse signal)
 - Continuous signal (potential free pulse signal)
- Remote control-side On/Off prohibition (potential free static signal)

Output

- On signal (potential free normal contact)
- Indoor/Outdoor alarm signal (potential free normal contact)

* The power supply is not necessary if 10P-1 to 10P-4 of the terminal block is not used.

1772_M_1

Dimension

1773_M_1

2. Optional Controller (remote sensor)

■ How to install the remote sensor

WARNING

Do not supply power to the unit or try to operate it until the tubing and wiring to the outdoor unit is completed.

■ Accessories

No.	Accompanying parts	Q'ty
①	Remote sensor (comes with 200 mm wire)	1
②	Machine screws M4 × 25	2
③	Wood screws	2

No.	Accompanying parts	Q'ty
④	Spacers	2
⑤	Wire joints	3
⑥	Installation manual	1

CAUTION

- Do not twist the remote sensor wiring with the power wiring or run it in the same metal conduit, because this may cause malfunction.
- Install the remote sensor away from sources of electrical noise.
- Install a noise filter or take other appropriate action if electrical noise affects the power supply circuit of the unit.

The mounting position for the remote sensor should be located in an accessible place for control. Never cover over the simplified remote controller or recess it into the wall.

- (1) Insert a screwdriver or the like in the groove on the lower side of the remote sensor body to pry off the back case.

When using a wall box for flush mounting

- If local codes allow, this remote sensor can be mounted using a conventional wall box for flush mounting.
- (2) Use the two supplied M4 machine screws to secure the remote sensor back case. Prior to mounting, push open the cutouts in the back case corresponding to the holes in the wall box using a screwdriver or the like. Use the spacers and take care not to tighten the screws excessively. If the back case will not seat well, cut the spacers to a suitable thickness.
 - (3) Connect the remote controller wires (3 wires) to the electric cable from the remote sensor body. (See "How to wire the remote sensor")

When connecting the remote sensor wires, check the terminal numbers in the indoor unit to make sure that the wires are correctly connected.

(The remote sensor is damaged if 220 / 240 V AC is applied.)

- (4) Fit the remote sensor body to the tabs of the back case into the remote sensor body and mount it.

Place of installation

- Mount the remote sensor at a height of 1 to 1.5 meters above the floor where it can sense the average temperature of the room.
- Do not mount the remote sensor in a place exposed to direct sunlight or a place exposed to outside air such as near a window.
- Do not mount the remote sensor behind an object so that it is separated from the air circulation of the room.
- Mount the remote sensor in a room air conditioned.
- The remote sensor must be installed perpendicular to the wall or other surface it is mounted on.

2. Optional Controller (remote sensor)

■ How to wire the remote sensor

● Connection diagram

*1: 0.5 mm² to 1.6 mm² of the wires are used for lead wires.

● How to connect lead wires

3 supplied white wire joints	<p>Lead wire from indoor unit</p> <p>Lead wire from remote sensor body</p> <p>Wire joint</p>	<ol style="list-style-type: none"> 1. Peel off 14 mm of the cable sheathing. 2. Twist the two wires together and crimp them together with the wire joint. 3. When a crimping tool is not used, solder the wires together and cover the joint with insulating tape.
------------------------------	--	---

■ Guidelines for using a remote controller and a remote sensor

● Set-up procedure

Use the following procedure for setting up.

- ① Use the remote controller as a sub-remote controller. Set the remote controller address switch on the remote controller PCB from OFF to ON. The remote controller can now be used as a sub-remote controller.

● Basic wiring diagram

CAUTION

Make sure to connect the wires correctly or the unit may be damaged.

- Following is a wiring diagram for controlling one indoor unit by a remote sensor and a remote controller.

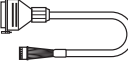

2. Optional Controller (S-DDC)

● Dimension

1835_M_1

● Electrical specs.

Rated voltage
: 220/230/ 240 V

Frequency
: 50 Hz

Input
: 8 W

Net weight
: 1.5 kg

CAUTION

- Do not strand or twist AMY control wire and input-output wire with power cord, or thread them through a metallic pipe because it may causes faulty operation.
- Install S-DDC apart from electrical noise source.
- Do not install AMY adapter where water splashes or humid place.
- Avoid excessive vibration and shock.

1836_M_1

Hook the AMY adapter to the fixture

Screw for slip-off prevention

1837_M_1

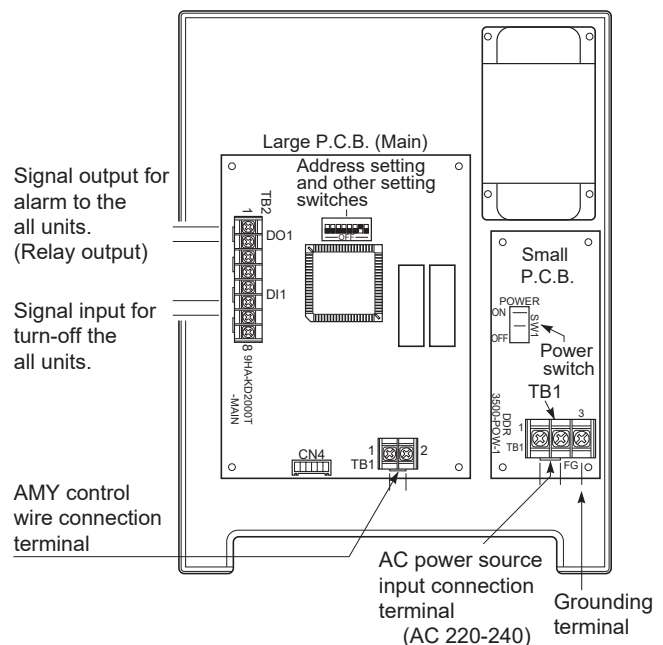

- (1) Secure the fixture according to the <Measurement for installation>.
- (2) Hook the adapter to the fixture.
- (3) When the fixture is loose and the S-DDC seems to be slipped off, secure the S-DDC with a screw removing the upper lid of the S-DDC.

■ Layout electrical terminals

When connecting or disconnecting S-DDC, turn off the power source. Remove two screws fixing upper lid, then remove the lid.

- (1) Connecting the power source.

Apply AC 220 V to 240 V of the power source to S-DDC. Connect the power cord <TB1-1> and <TB1-2> on the small size printed circuit board in S-DDC.

1838_M_1

2. Optional Controller (S-DDC)

(2) Connecting control wires.

Use two-core, 0.5 mm² to 1.6 mm² lead wire for AMY control wire. The limited length of control wire is 1,000 m in total. The control wire has no polarity.

CAUTION

- Do not thread the AMY control wire through a metallic pipe with power cord.
- Do not wire the power cord and the control wires together in a same cable or do not wire the power cord near the control wires. For AMY control wire, use signal wire which is different from power code.

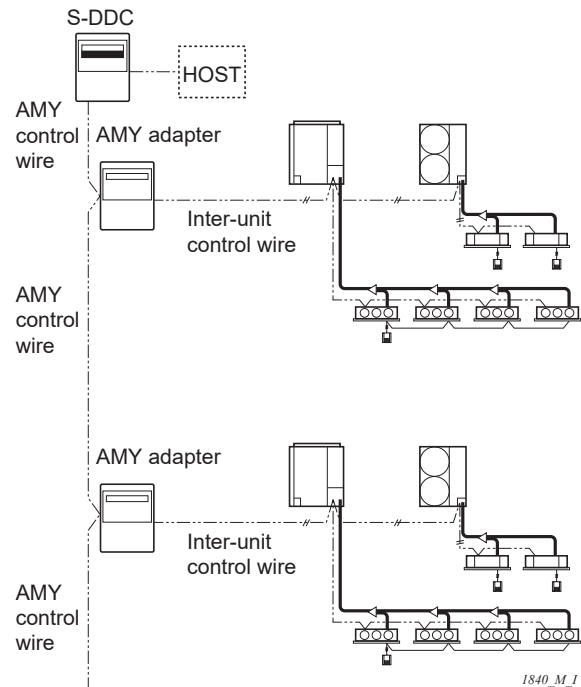

- MVVS or CPEVS: Shielding wire from 0.5 mm² to 1.6 mm².
- Use shielding wire for AMY and inter-unit control wiring and ground the shielding on both sides (See below), otherwise misoperation from noise may occur.

■ Wiring diagram

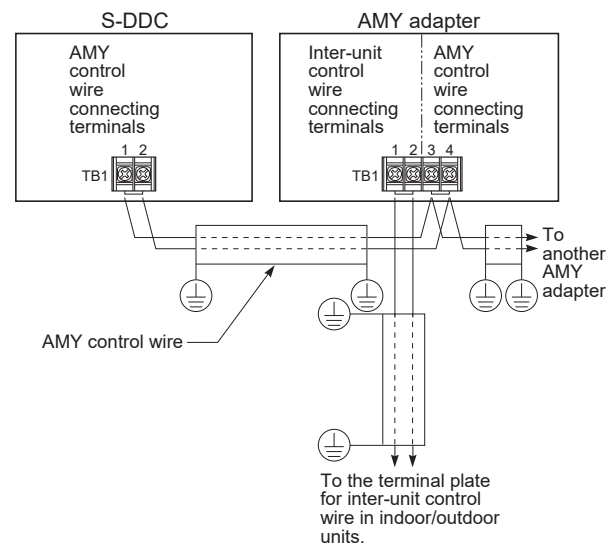

AMY and inter-unit control wiring for AMY adapter should be wired as shown below.

- When using S-DDC:
UP to 32 AMY adapters can be connected.

■ Wiring procedure

- AMY control wire is used to connect between S-DDC and AMY adapter. Connect AMY control wire between the terminals ① and ② on the terminal plate TB1 of large P.C.B. in S-DDC and the terminals ③ and ④ on the terminal plate TB1 of large P.C.B. in AMY adapter.

2. Optional Controller (S-DDC)

● RS-232C cable

RS-232C cable is used to connect between the terminals CN4 of the large P.C.B. in S-DDC and Host Computer. The cable should be fixed to S-DDC with nylon clasper as shown below.

(2) Branch wiring

If branching the inter-adapter control wiring, the number of branches should be 16 or less. (Branch length less than 1 m is not included in the total branch number.)

NOTE

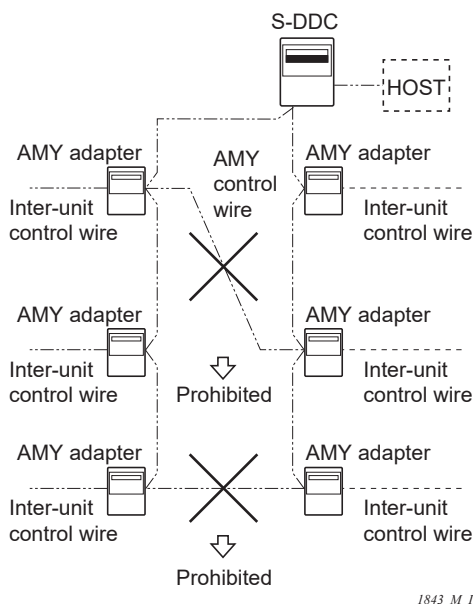

1. Up to 3 wires can be branched off from the terminal. (Please refer to the following example of branch wiring.)

4 wires or more can not be branched from the terminal.

■ Precautions when wiring AMY control wire

- (1) Do not wire the inter-adapter control wiring such as loop wiring as shown below.

2. Branch length less than 1 m is not included in the total branch number.

3. AMY control wire length between branches should be 2 meter or more as shown below.

CAUTION

- Do not connect the power supply cord to the AMY control wire terminal. Otherwise the P.C.B. in the AMY adapter will be damaged.

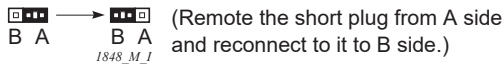

NOTE

In case of emergency, the P.C.B. can be used by reconnecting CN3 short plug from A side to B side after correcting wiring.

<Turn off the power supply switch before reconnecting the short plug>

2. Optional Controller (S-DDC)

Main P.C.B. for S-DDC

(When shipped from factory) (Emergency)

- Check if the short plug for AMY control wiring is connected to B side.

Main P.C.B. for S-DDC

Switch setting

- SW1-1: Filter sign (timer) function
 OFF : With air filter sign (timer) function (When shipped from factory)
 ON : Without air filter sign (timer) function
- SW1-5: RS ON/OFF
 OFF : RS switch is always OFF (When shipped from factory)
 ON : *RS switch is always ON
- SW1-6: Changing baud rate
 OFF : 4800 bps (When shipped from factory)
 ON : 9600 bps
- SW1-8: Test mode
 Use this switch is always OFF

NOTE

* In case of Host Computer (Program) has CD (Carrier Detect) function, RS switch is always ON

Connection to the outside equipments

- Signal input for turn-off the all units. (Potential free normal open contact) <Inputting photo coupler>

- Signal output for alarm to the all units. (Potential free normal open contact) <It will be shortened, when detecting alarm signal>

- Control wires used for inputting signals are field supply. Maximum wiring length is 100 m. Use 2-core shielding wires 0.5 mm² or more for the places where misoperation may occur from the noise.

- Input & output for RS-232C

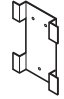

- Cross cable for RS-232C is field supply. Maximum length is less than 15 m.

2. Optional Controller (AMY adapter)

Net weight
: 1.5 kg

CAUTION

- Do not strand or twist inter-unit control wire. AMY control wire and input-output wire with power cord, or thread them through a metallic pipe because it may causes faulty operation.
- Install AMY adapter apart from electrical noise source.
- Do not install AMY adapter where water splashes or humid place.
- Avoid excessive vibration and shock.

1836_M_1

Hook the AMY adapter to the fixture

Screw for slip-off prevention

1854_M_1

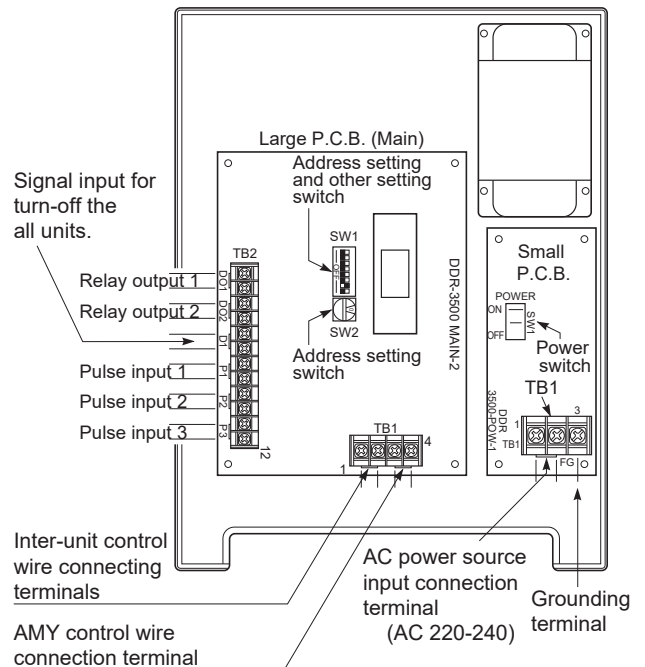

- (1) Secure the fixture according to the <Measurement for installation>.
- (2) Hook the adapter to the fixture.
- (3) When the fixture is loose and the AMY adapter seems to be slipped off, secure the AMY adapter with a screw removing the upper lid of the AMY adapter.

■ Layout electrical terminals

When connecting or disconnecting AMY adapter, turn off the power source. Remove two screws fixing upper lid, then remove the lid.

- (1) Connecting the power source.

Apply AC 220 V to 240 V of the power source to AMY adapter. Connect the power cord <TB1-1> and <TB1-2> on the small size printed circuit board in AMY adapter.

1855_M_1

2. Optional Controller (AMY adapter)

(2) Connecting control wires.

Use two-core, 0.5 mm² to 1.6 mm² lead wires for both AMY control and inter-unit control wires. The limited length of control wire is 1,000 m in total. The control wire has no polarity.

CAUTION

- Do not thread the AMY control and inter-unit control wires through a metallic pipe with power cord.
- Do not wire the power cord and the control wires together in a same cable or do not wire the power cord near the control wires. Both AMY control and inter-unit control wires should be different from power code.

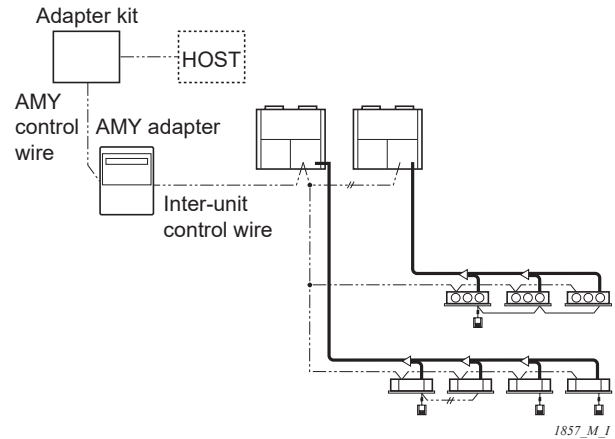

- MVVS or CPEVS: Shield wire from 0.5 mm² to 1.6 mm²
- Use shielded wires for inter-unit control wiring and ground the shielded on both side (See below), otherwise misoperation from noise may occur.

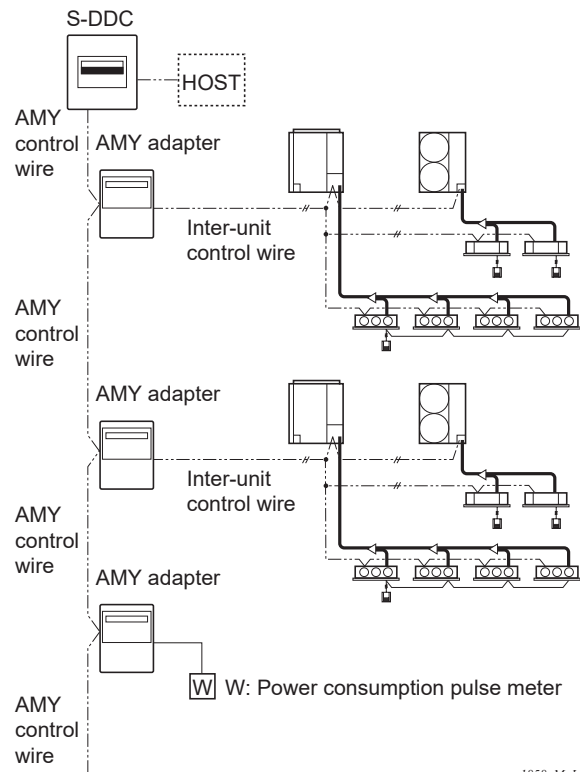

■ Wiring diagram

AMY and inter-unit control wiring for AMY adapter should be wired as shown below.

- When using adapter kit:
Only one AMY adapter can be connected.

- When using S-DDC:
Up to 32 AMY adapters can be connected.

2. Optional Controller (AMY adapter)

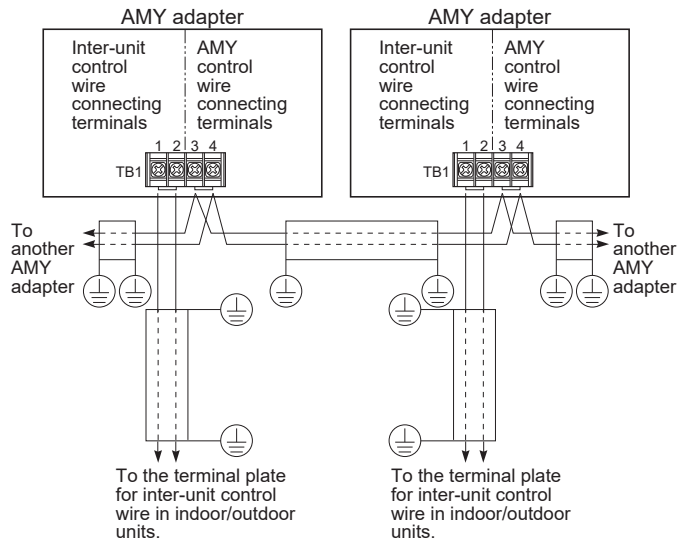

■ Wiring procedure

● Inter-unit control wire

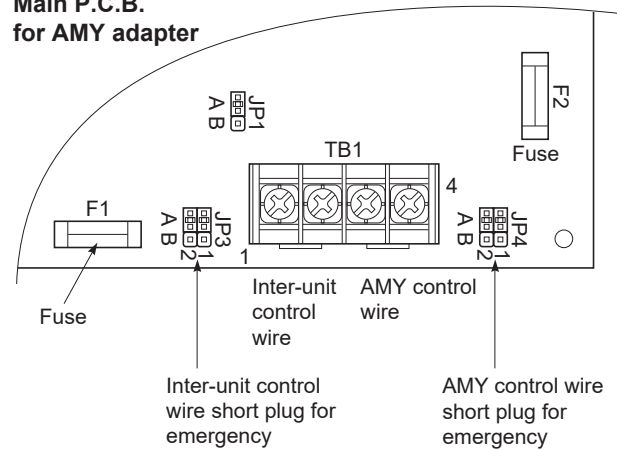

Inter-unit control wire is used to connect between the AMY adapter and the indoor or the outdoor unit. Connect the inter-unit control wire to the terminals ① and ② on the terminal plate TB1 of large P.C.B..

● AMY control wire

AMY control wire is used to connect between the AMY adapters. Connect the AMY control wire between the terminals ③ and ④ on the terminal plate TB1 of large P.C.B. and the terminals ③ and ④ in another AMY adapter.

Main P.C.B. for AMY adapter

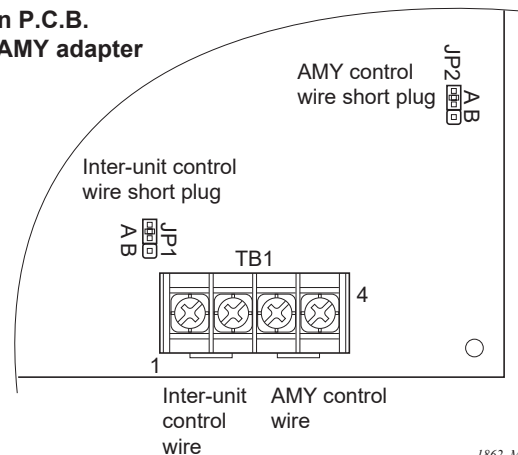

1860_M_I

(When shipped from factory) (Emergency)

- Connecting short plug to inter-unit control wiring
Check if the short plug (CN31: 2P. black terminating resistor) of the whole outdoor units except one outdoor unit are removed from outdoor units P.C.B.. JP1 on large P.C.B. (Main) in the AMY adapter is the short plug (the terminating resistor) is connected. When shipped from factory, short plug is plugged at B side.

Main P.C.B. for AMY adapter

1862_M_I

- Connecting short plug to AMY control wiring

■ Precautions when wiring AMY control

CAUTION

- Do not connect the power supply cord to the AMY control wire terminal and inter-unit control terminal.
- Otherwise the P.C.B. in the AMY adapter will be damaged.

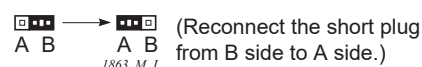

NOTE

In case of emergency, the P.C.B. can be used by reconnecting JP3 or JP4 short plug from A side to B side after correcting wiring.

<Turn off the power supply switch before reconnecting the short plug>

Important

When connecting the short plug to the adapter kit, keep the short plug (JP2) at B side. When connecting the short plug to S-DDC, reconnect the short plug (JP2) from B side to A side of the whole connected AMY adapters.

(When shipped from factory)

1863_M_I

2. Optional Controller (AMY adapter)

Switch setting

How to set the address switch

When connecting to the adapter kit, no need to set the address switch. (When shipped from factory, setting is 0.)
When connecting to S-DDC, set address switches of whole connected AMY adapters, as follows.

(When shipped from factory, setting is 0.)

Connection to the outside equipments

- Signal input for turn-off the all units. (Potential free normal open contact)
<Inputting photo coupler>

- Do not apply voltage to D1 input terminal. Take care not to share one of the input terminals with other input. Since the D1 input terminal is used for potential free contact.

- Inputting by pulse counter (Potential free normal open contact)
<Inputting photo coupler>

- AMY adapter counts the number of pulses which the outer contact turns on through the input terminal P1, P2 and P3. Since the contact is potential free, do not apply voltage. AMY adapter will be damaged. Please take care that input terminal can not be connected with other input.

- Control wires used for inputting signals are field supply. Maximum wiring length is 100 m. Use 2-core shielded wires 0.5 mm² or more for the places where misoperation may occur from the noise.

CONDITION	: Center, Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

- REMARKS:**
- Value obtained in the actual place where the unit is installed may be slightly higher than the values shown in this graph because of the conditions of operation, the structure of the building, the background noise and other factors.
 - The test results were obtained from an anechoic room.

NOTE To evaluate "Noise level" the maximum number of the measured OCTAVE BAND SOUND PRESSURE LEVEL is used. Read the number on each BAND CENTER FREQUENCIES (horizontal axis) ranging from 63 Hz to 8000 Hz and select the maximum value (vertical axis) among them.

3. 2-Way Air Discharge Semi-concealed Type

3-4. Noise criterion curves

MODEL	: SPW-SR93GH56
	SPW-S93GH56
SOUND LEVEL	: HIGH 32 dB(A), NC 29
	LOW 25 dB(A), NC 21
CONDITION	: Center, Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

MODEL	: SPW-SR123GH56
	SPW-S123GH56
SOUND LEVEL	: HIGH 33 dB(A), NC 29
	LOW 26 dB(A), NC 22
CONDITION	: Center, Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

- REMARKS :**
1. Value obtained in the actual place where the unit is installed may be slightly higher than the values shown in this graph because of the conditions of operation, the structure of the building, the background noise and other factors.
 2. The test results were obtained from an anechoic room.

NOTE

To evaluate "Noise level" the maximum number of the measured OCTAVE BAND SOUND PRESSURE LEVEL is used. Read the number on each BAND CENTER FREQUENCIES (horizontal axis) ranging from 63 Hz to 8000 Hz and select the maximum value (vertical axis) among them.

3. 2-Way Air Discharge Semi-concealed Type

MODEL	: SPW-SR183GH56
	SPW-S183GH56
SOUND LEVEL	: HIGH 34 dB(A), NC 29
	LOW 27 dB(A), NC 24
CONDITION	: Center, Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

MODEL	: SPW-SR253GH56
	SPW-S253GH56
SOUND LEVEL	: HIGH 37 dB(A), NC 33
	LOW 30 dB(A), NC 29
CONDITION	: Distance 1 m, Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

4

Unit specifications (C)

MODEL No.	Indoor Unit		SPW-TR363GH56	
POWER SOURCE			220 - 230 - 240 V / 1 phase / 50Hz	
PERFORMANCE			Cooling	Heating
Capacity	kW		10.6	11.4
	BTU / h		36,000	39,000
Air circulation (Hi / Me / Lo)	m ³ / h		1,680 / 1,410 / 1,200	
Moisture removal (High)	Liters / h		4.7	—
ELECTRICAL RATINGS				
Voltage rating	VAC		220 - 230 - 240	
Available voltage range	VAC		198 - 264	
Running amperes	A		0.95 - 0.96 - 0.98	0.86 - 0.88 - 0.90
Power input	W		200 - 210 - 220	180 - 190 - 200
Power factor	%		96 - 95 - 94	95 - 94 - 93
Fan motor locked rotor amperes	A		2 - 2 - 2	
FEATURES				
Controls			Microprocessor	
Timer			ON / OFF Timer (Max. 72 hr)	
Fan speeds (Indoor unit)			3 and Automatic control	
Air filter			Washable, easy access, long life (2,500 hr)	
Refrigerant control			Electronic expansion valve	
Operation sound (Hi / Me / Lo)	dB-A		42 / 40 / 35	
Refrigerant tubing connections			Flare type	
Refrigerant tube diameter	Narrow tube	mm (in)	9.52 (3 / 8)	
	Wide tube	mm (in)	19.05 (3 / 4)	
Drain connection			20 A, OD26 mm	
Remote Controller			Optional (RCS-SH80TG)	
Refrigerant tubing kit / Accessories			Optional / —	
Color (Approximate value)			Munsell 10Y9.3 / 0.4, RAL 9010-GL

 CONDITION : Under the unit 1.5 m
 SOURCE : 220 - 230 - 240 V, 1 Phase, 50 Hz

MODEL : SPW-UR483GHN56
 SOUND LEVEL : HIGH 40 dB(A), NC 33 / LOW 33 dB(A), NC 25
 CONDITION : Under the unit 1.5 m
 SOURCE : 220 - 230 - 240 V, 1 Phase, 50 Hz

- REMARKS:**
1. Value obtained in the actual place where the unit is installed may be slightly higher than the values shown in this graph because of the conditions of operation, the structure of the building, the background noise and other factors.
 2. The test results were obtained from an anechoic room.

NOTE

To evaluate "Noise level" the maximum number of the measured OCTAVE BAND SOUND PRESSURE LEVEL is used. Read the number on each BAND CENTER FREQUENCIES (horizontal axis) ranging from 63 Hz to 8000 Hz and select the maximum value (vertical axis) among them.

4

7. Concealed Duct Type

7-5. Increasing the fan speed

If external static pressure is too great (due to long extension of ducts, for example), the air flow volume may drop too low at each air outlet. This problem may be solved by increasing the fan speed using the following procedure:

- (1) Remove 2 screws on the electrical component box and remove the cover plate.
- (2) Disconnect the fan motor sockets in the box.
- (3) Take out the booster cable (sockets at both ends) clamped in the box.
- (4) Securely connect the booster cable sockets between the disconnected fan motor sockets in step 2 as shown in the Fig. 7-1.
- (5) Place the cable neatly in the box and reinstall the cover plate.

NOTE HT : Using the booster cable
 H : At shipment

Fig. 7-2

How to read the diagram

The vertical axis is the external static pressure (Pa) while the horizontal axis represents the AIR FLOW (m³/minute). The characteristic curves for "HT", "H", "M" and "L" fan speed control are shown. The nameplate values are shown based on the "H" air flow. For the 25 type, the air flow is 18 m³/minute, while the external static pressure is 49 Pa at "H" position. If external static pressure is too great (due to long extension of duct, for example), the air flow volume may drop too low at each air outlet. This problem may be solved by increasing the fan speed as explained above.

0313_D_1

0314_D_1

MODEL	: SPW-DR483GH56 SPW-D483GH56
SOUND LEVEL	: HIGH 47 dB(A), NC 42
CONDITION	: Under the unit 1.5 m
SOURCE	: 220 - 230 - 240 V, 1 Phase, 50 Hz

0315_D_1

- REMARKS:**
1. Value obtained in the actual place where the unit is installed may be slightly higher than the values shown in this graph because of the conditions of operation, the structure of the building, the background noise and other factors.
 2. The test results were obtained from an anechoic room.

NOTE

To evaluate "Noise level" the maximum number of the measured OCTAVE BAND SOUND PRESSURE LEVEL is used. Read the number on each BAND CENTER FREQUENCIES (horizontal axis) ranging from 63 Hz to 8000 Hz and select the maximum value (vertical axis) among them.

4

8. Concealed Duct High Static Pressure Type

8-5. R.A.P. valve kit

- Connect two units in parallel for each indoor unit.
- Attach the R.A.P. valve kit within 30 meters from the indoor unit.
- Secure the R.A.P. valve kit using hanging bolts, etc.
- Be absolutely sure to install the R.A.P. valve kit top side up.
- Do not place the R.A.P. valve kit directly on the ceiling.
- The R.A.P. valve kit is required when a multiple number of type 76 or 96 units are to be connected to the same system.
- The R.A.P. valve kit is required when a type 76 or 96 indoor unit is to be connected among other indoor units.

- ① Refrigerant liquid line (ø9.52)
- ② Refrigerant gas line (ø19.05)
- ③ Strainer for refrigerant gas line
- ④ Service-cover

1782_M_1

8. Concealed Duct High Static Pressure Type

8-6. Indoor fan performance

How to Read the Diagram

The vertical axis is the EXTERNAL STATIC PRESSURE (mmAq) while the horizontal axis represents the AIR FLOW (m³/minute). The characteristic curve for the “H”, “Med”, and “Lo” fan speed control.

The name plate values are shown based on the “H” air flow. Therefore in the case of the 25 type the flow is 23 m³/minute, while the EXTERNAL STATIC PRESSURE is 19 mmAq at “H” position. If the external static pressure is too great (due to long extension of duct, for example), the air flow volume may drop too low at each air outlet.

25, 27 Type

36 Type

48 Type

8. Concealed Duct High Static Pressure Type

Increasing the Fan Speed (96 type only)

If external static pressure is too great (due to long extension of ducts, for example), the air flow volume may drop too low at each air outlet. This problem may be solved by increasing the fan speed using the following procedure:

- (1) Remove 4 screws on the electrical component box and remove the cover plate.
- (2) Disconnect the fan motor sockets in the box.
- (3) Take out 2 booster cables from option curtain box (sockets at both ends).
- (4) Securely connect 2 booster cable's sockets between the disconnected fan motor sockets in step 2 as shown in the Fig. 8-1.
- (5) Place the cable neatly in the box and reinstall the cover plate.

10-6. Indoor fan performance

How to Read the Diagram

The vertical axis is the EXTERNAL STATIC PRESSURE (mmAq) while the horizontal axis represents the AIR FLOW (m³/minute). The characteristic curve for the "H", "Med", and "Lo" fan speed control.

The name plate values are shown based on the "H" air flow. Therefore in the case of the 25 type the flow is 17 m³/minute, while the EXTERNAL STATIC PRESSURE is 1.5 mmAq at "H" position. If the external static pressure is too great (due to long extension of duct, for example), the air flow volume may drop too low at each air outlet.

1-3. Alarm messages on CCU (CR-DYPTG).....	V - 6
2. Electrical Work	V - 10
2-1. Electrical wiring	V - 10
2-2. Noise countermeasures of control wiring	V - 11
3. Installation Standards Important	V - 12
3-1. Method of gas leak inspection after completing the tubing	V - 12
3-2. Check of density limit	V - 13
3-3. Precautions for new refrigerant installation	V - 14
3-4. New refrigerant R407C cannot be used for existing models	V - 15

1. Test Run

1-1. Test run procedure

1785_M_1

NOTE

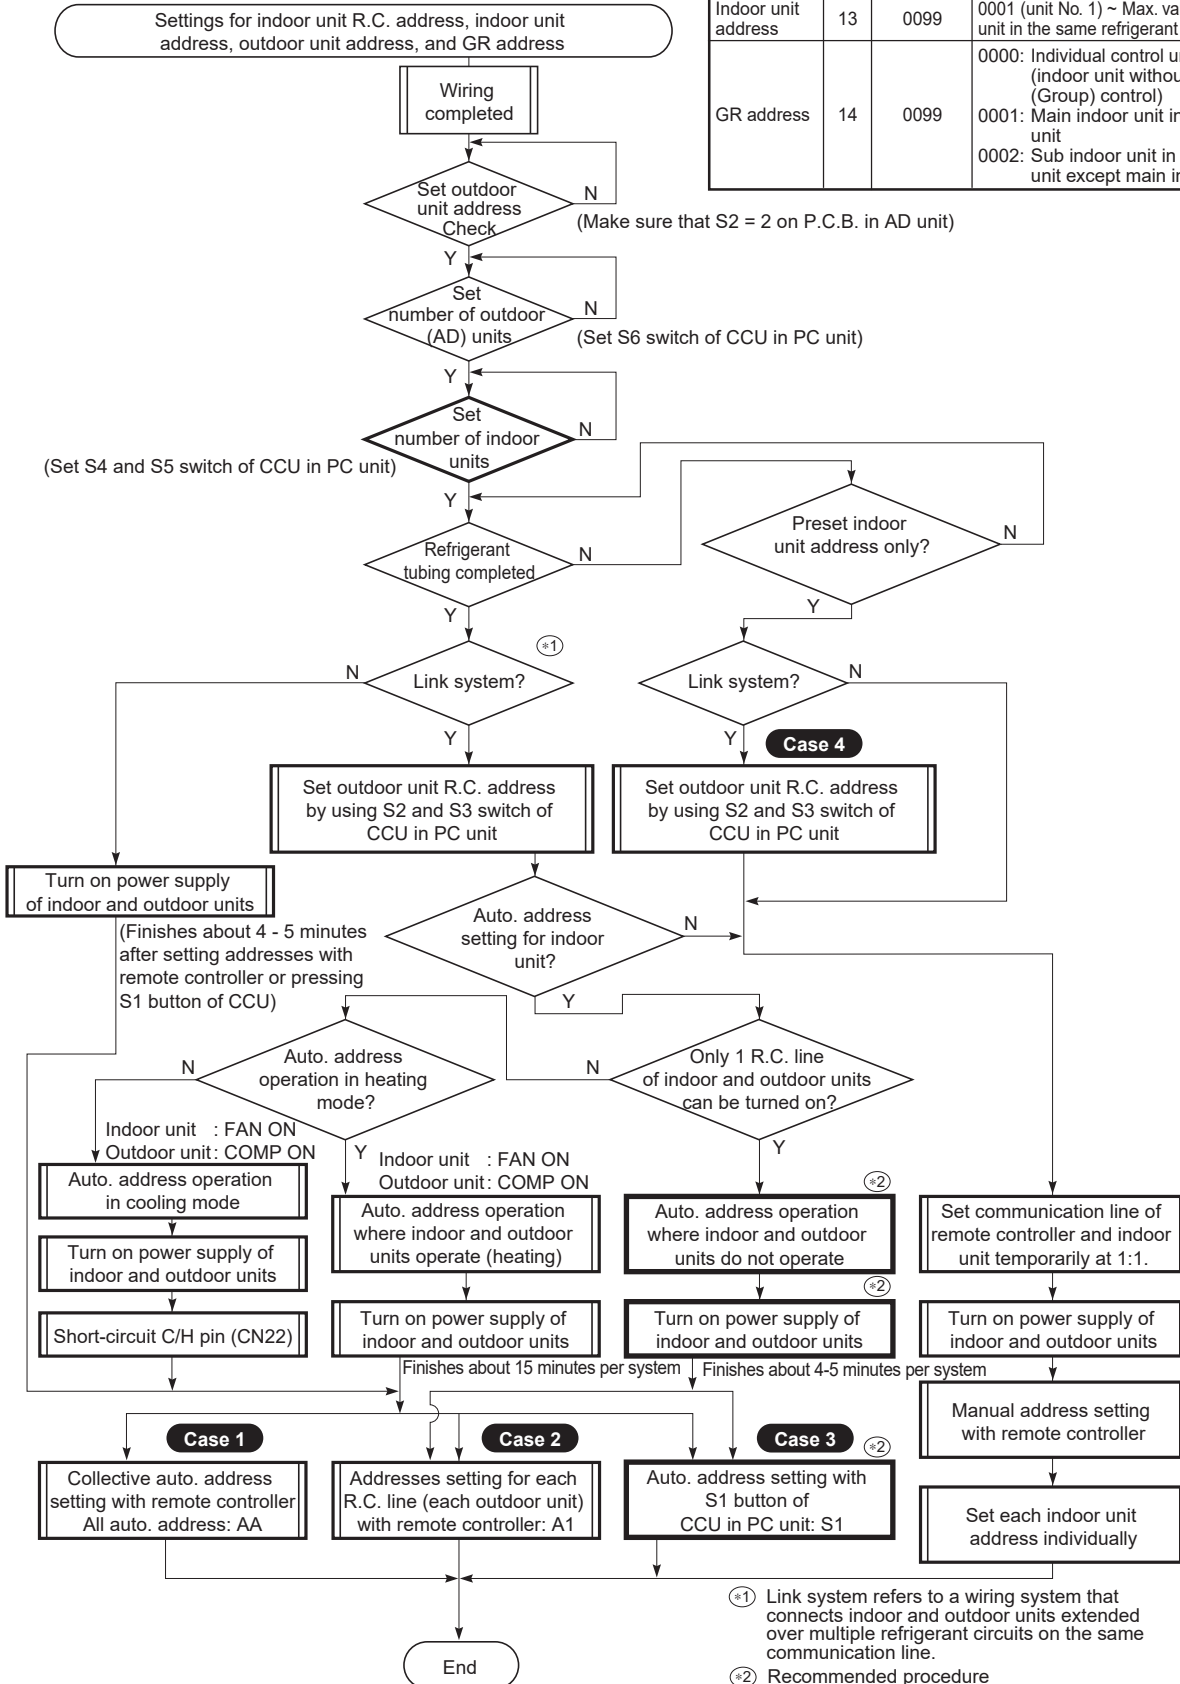

- 1) Auto. address operation decides each indoor unit address to the indoor unit connected to the refrigerant circuit individually.
The required time of operation depends on the temperature.
It takes a maximum of 20 minutes for a link system.
It takes a maximum of about 3 minutes without turning on the compressor, for a system without link.
- 2) When linking outdoor units in a network (link system), Auto. address operation should be performed by each refrigerant circuit (outdoor unit) individually. If you start Auto. address operation of another refrigerant circuit during Auto. address operation, the alarm message (E12) will be displayed.
- 3) Indoor unit address can be changed manually with the remote controller when required.
- 4) The selected indoor unit address is memorized in EEPROM even after power failure.
- 5) When using a system controller, zone registration is required after finishing the test run.

1. Test Run

● Test run procedure in detail

● The following addresses will be set in EEPROM (IC8) on indoor P.C.B. after test run. (Data is not set when shipped from factory).

	Item code	Factory setting data	Setting data
R.C. address	12	0099	0001 (unit No. 1) ~ 0030 (unit No. 30)
Indoor unit address	13	0099	0001 (unit No. 1) ~ Max. value of indoor unit in the same refrigerant circuit
GR address	14	0099	0000: Individual control unit (indoor unit without GR (Group) control) 0001: Main indoor unit in GR control unit 0002: Sub indoor unit in GR control unit except main indoor unit

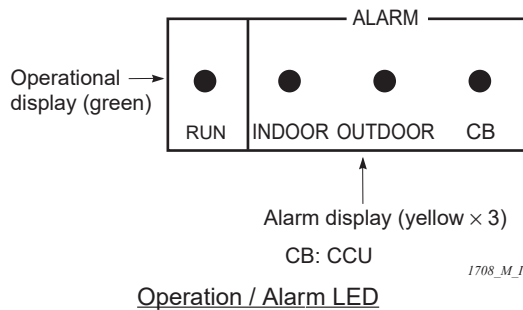

1. Test Run

1-2. Monitor and self-diagnostic function

■ Monitor function for CCU (CR-DYPTG) in PC unit

By selecting the Item SW (S7) and Select SW (S8), the LED will display all the necessary information to be monitored. The monitored information stored in memory can be deleted by turning off the power supply.

● Location and name of LED on CCU in PC unit.

● Display messages when using the item and select switches

☼ : light ON / blink ● : light OFF

ITEM SW (S7) 0~F	SELECT SW (S8) 1~4	Item	Message displayed			
			RUN / ALARM LED		MESSAGE LED	
0 (Initial setting)	-	Display of the number of connected indoor units	☼ ● ● ●	● ● ● ●	Display of the number of indoor units	
		Display of alarm messages for indoor unit * Displayed at the time of operation	☼ ☼ ● ●	● ● ● ●	Display of the number of indoor units	
		Display of alarm messages for outdoor unit	☼ ● ☼ ●	● ● ● ●	Vertical LED : Lights up unit where alarm is being issued [unit No. 1 (PC unit), unit No. 2 and No. 3 (AD units)] Horizontal LED : Displays alarm messages	
		Display of alarm messages for CCU	☼ ● ● ●	☼ ● ● ●	Vertical LED : Displays progress of auto. address operation Horizontal LED : Displays alarm messages	
		Display during auto. address operation	☼ ● ● ●	● ● ● ●	Vertical LED : All off Horizontal LED : 1 and 2 blink alternately Note) CB: CCU	
		* If either outdoor or CB alarm message is displayed during auto. address operation, the alarm can be conformed by selecting "4" on the Item switch.				

5

1. Test Run

ITEM SW (S7) 0~F	SELECT SW (S8) 1~4	Item	Message displayed	
			RUN / ALARM LED	MESSAGE LED
1	1~4	Display of connected indoor unit	RUN / ALARM LED display does not affect monitored information.	Vertical LED : Lights up starting from 1 in sequence by pressing the Select switch each time Horizontal LED : Lights up in accordance with connected unit on the vertical LED (blinks if the indoor unit has an alarm)
2	1~4	Display of connected indoor unit in operation		Vertical LED : Lights up starting from 1 in sequence by pressing the Select switch each time Horizontal LED : Lights up in accordance with connected operating unit on the vertical LED (blinks if the indoor unit has an alarm)
3	–	Display of the number of connected outdoor units		Vertical LED : OFF Horizontal LED : Lights up the number of connected outdoor units
4	–	Display of alarm history		Vertical LED : If alarm occurs on outdoor unit, the unit lights up. OFF when alarm occurs on CCU Horizontal LED : Displays latest alarm message for all outdoor units and CCU
5	1~4	Display of oil level monitor		Vertical LED : Lights up in accordance with outdoor units selected with the Select SW (S8) Horizontal LED : Displays oil level of outdoor unit compressor indicated on the vertical LED (same as outdoor PCB display for parts inspection method on page).
6	1~4	Display of alarm history for outdoor unit		Vertical LED : Lights up in accordance with outdoor units selected with the Select SW (S8) Horizontal LED : Displays latest alarm message for outdoor unit indicated on the vertical LED * Latest alarm message can be monitored for individual outdoor unit including the information that can be monitored by using the Item "4".

■ Explanation for MESSAGE LED (Horizontal LED red, 8 lamps / vertical LED red, 4 lamps)

- It normally indicates the number of connected indoor units (up to 32 units). Refer to Fig. 1-9 for example of display.
- In case of outdoor unit and CCU alarm, both outdoor alarm LED (yellow) and CB alarm LED (yellow) light up and alarm messages are displayed on LED as shown in Fig. 1-10.
- Outdoor unit alarm display includes alarm messages on 8 horizontal LED lamps and outdoor unit number causing the alarm on 4 vertical LED lamps.
(vertical LED 1 lights up: outdoor PC unit alarm / vertical LED 2 and 3 light up: outdoor AD unit, alarm for unit No. 2 and No. 3)
- In case of CCU alarm, all vertical LED lamps are off and only 8 horizontal LED lamps display alarm messages.
- If outdoor alarm LED (yellow) is OFF, any of vertical LED 1 - 3 lights up, and 8 horizontal LED lamps blink, it is not displayed on the remote controller due to temporary protective operations generated by outdoor unit. After releasing the protective operations, the number of connected indoor units is displayed.

Fig. 1-9

Fig. 1-10

1. Test Run

1-3. Alarm messages on CCU (CR-DYPTG)

- * During normal operation, either "OUTDOOR" or "CB" alarm lamp on CCU lights up with alarm display of LED1-8 (red).
- * In case either "OUTDOOR" or "CB" alarm lamp lights up during automatic address operation, turn the "ITEM" switch to "4" to display alarm messages on LED 1-8 (red).
- * In case of "INDOOR" alarm, only alarm LED lights up, and alarm messages are not displayed on LED 1-8 (red).

● **Monitor function of oil level**

Oil level of compressor can be monitored by setting of DIP switch on each outdoor unit P.C.B..

① PC unit

Set DIP switch S1-5 to ON on the main P.C.B.. (Fig. 1-11)
* Main P.C.B. is the larger P.C.B. in PC unit.

Oil P	3	2	1	Oil level

	●	☼	☼	Insufficient
	●	●	☼	None

Fig. 1-12

2. Electrical Work

2-1. Electrical wiring

- Do not mistake the polarities of the wiring for group control and central control.
- Take the power supply for indoor units separately in units of each outdoor unit.

■ Cautions on electrical work

- Regulations on wire diameters differ from locality to locality.
For field wiring rules, please refer to your LOCAL ELECTRICAL CODES before beginning.
You must insure that installation complies with all relevant rules and regulations.
- Invariably draw the power from a dedicated branch circuit.
- Fasten the power wiring and inter-unit operating wiring with the “code fixtures accompanying the units, and make sure that they do not contact the refrigerant tubing, valves, etc.
- Do the electrical wiring to the outdoor unit by drilling a hole onto the “power connection panel” matching to the thickness of conduit, using a hole saw. It can be done from both the left / right sides. (eyelet rubber)
- After wiring the indoor unit, seal the power intake clearance with the accompanying putty.
- Invariably match the wiring of indoor / outdoor units (incorrect wiring will result in damage).
- Do not carry the remote controller wiring, inter-unit operating wires, or central control wiring in the same conduit as the power wiring, or wire them with the same cables, or wire them close to each other.
- Use shield wires for remote controller wiring and inter-unit operating wires. And, invariably earth only one side of the shield wires.
- Keep the power cord of air conditioner and inter-unit cables 3m or more way from the main units, antenna, signal lines, power cord etc. of any TV, radio, stereo, interphone, personal computer, work processor, telephone, etc. Otherwise, noise may affect them.

2. Electrical Work

2-2. Noise countermeasures of control wiring

■ Signal line wiring between micro computer mounted devices

Countermeasures: Signal connecting wiring, remote controller wiring, and group control wiring between the indoor / outdoor units

Along with the introduction of micro computer in air conditioners, misoperation due to noise or inter-device interference is at times generated. To prevent this, always use a shielded wire for making serial communication.

● Types of shielded wires

- *1. Use a shield wire having a shield of braided type and twist pitch of about 2-inch or lesser.
- *2. Use a core wire of 0.75 mm² or more thickness
- *3. Use a wire of designated core count.
Core count designation:
Inter-indoor / outdoor unit connecting wires ... 2-core shielded wire

Fig. 2-1

Fig. 2-2

Fig. 2-3

● Engineering method

1. Ground the shield on both sides (Fig. 2-1)
2. Install the unit 3 m away from any nearby high frequency equipment.
* House the remote controller into an iron box, and its wiring into a wiring pipe or iron conduit.
3. Do not bundle the signal lines together with the power line or wire them with the same cable. (Fig. 2-2)
* If wired together, keep the distance between them more than 30 cm.

Current (A)	Distance between signal lines & power line
10 A or less	30 cm or more
50 A or less	50 cm or more
100 A or less	100 cm or more

4. Do not wire the signal lines of different equipment with multi-core cables. (Fig. 2-3)
5. When using a noise filter or noise cut transformer, firmly connect the earth wire of filter, etc. with the main unit of air conditioner. Of course, install an earth for the air conditioner. (Fig. 2-4)
6. Wire the primary and secondary side lead wires of noise filter and noise guard transformer away from each other. (Fig. 2-5)
7. Scrape off the paint from the joint of earth terminal in order to ensure that its connection resistance does not become large.

Fig. 2-4

Fig. 2-5

3. Installation Standards

3-1. Method of gas leak inspection after completing the tubing

1. Procedure

Connect the indoor unit, tubing, and outdoor unit, and check for gas leakage according to the following procedure (also check the service valve and the sealing of spindle).

1099_1143

2. Seal inspection

1) Pressurizing & standing time

Pressurize nitrogen gas from the narrow tube and wide tube of the charging port of service valve of each refrigerant tubing system.

- ① Step 1 Pressurize with 3 kg/cm² at first, and then 15 kg/cm² : Allow 5 min. or more each time
 ↓
 Check of large leaks possible
- ② Step 2 Pressurize with 30 kg/cm² : Leave standing for 24 hrs. or more
 ↓
 Check of fine leaks possible

2) Evaluation of leaks

- ① In case of no pressure drop
OK
- ② In case of pressure drop
 - * Check the leaking spots with soap water.
 - * In case no leaking spot can be detected with soap water
Inspect with gas leak tester, after sealing freon gas.

However, if there is a difference in ambient temperature at the time of pressuring and pressure drop checking, invariably evaluate by allowing for the compensation.

(The pressure changes by about 0.1 kg/cm² per 1 °C).

3. Installation Standards

3-2. Check of density limit

WARNING

Do not install the indoor unit to the place, such as a basement, etc. where refrigerant can stay, since refrigerant is heavier than air.

The room in which the air conditioner is to be installed requires a design that in the event of refrigerant gas leaking out, its density will not exceed a set limit.

The refrigerant (R22/R407C) which is used in the air conditioner is safe, without the toxicity or combustibility of ammonia, and is not restricted by laws to be imposed which protect the ozone layer. However, since it contains more than air, it poses the risk of suffocation if its density should rise excessively. Suffocation from leakage of refrigerant is almost non-existent. With the recent increase in the number of high density buildings, however, the installation of multi air conditioner systems is on the increase because of the need for effective use of floor space, individual control, energy conservation by curtailing heat and carrying power etc.

Most importantly, the multi air conditioner system is able to replenish a large amount of refrigerant compared with conventional individual air conditioners. If a single unit of the multi air conditioner system is to be installed in a small room, select a suitable model and installation procedure so that if the refrigerant accidentally leaks out, its density does not reach the limit (and in the event of an emergency, measures can be made before injury can occur).

In a room where the density may exceed the limit, create an opening with adjacent rooms, or install mechanical ventilation combined with a gas leak detection device. The density is as given below.

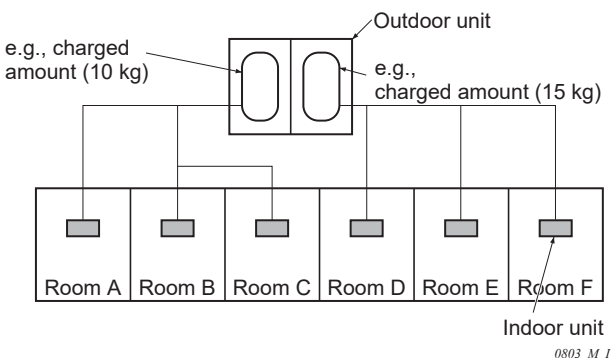

Total amount of refrigerant (kg)

Min. volume of the indoor unit installed room (m³)

$$\leq \text{Density limit (kg/m}^3\text{)}$$

The density limit of refrigerant which is used in multi air conditioners is 0.3 kg/m³ (ISO 5149).

NOTE 1 : If there are 2 or more refrigerating systems in a single refrigerating device, the amount of refrigerant should be as charged in each independent device.

For the amount of charge in this example:

The possible amount of leaked refrigerant gas in rooms A, B and C is 10 kg.

The possible amount of leaked refrigerant gas in rooms D, E and F is 15 kg.

NOTE 2 : The standards for minimum room volume are as follows.

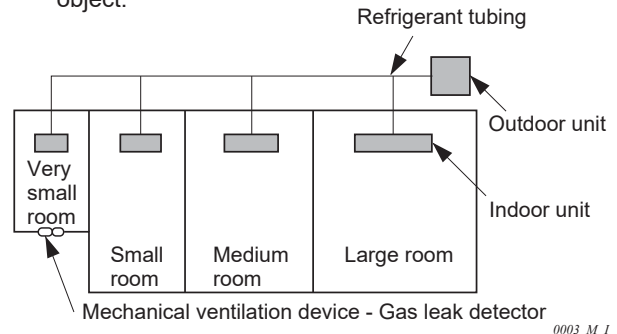

(1) No partition (shaded portion)

(2) When there is an effective opening with the adjacent room for ventilation of leaking refrigerant gas (opening without a door, or an opening 0.15% or larger than the respective floor spaces at the top or bottom of the door).

(3) If an indoor unit is installed in each partitioned room and the refrigerant tubing is interconnected, the smallest room of course becomes the object. But when a mechanical ventilation is installed interlocked with a gas leakage detector in the smallest room where the density limit is exceeded, the volume of the next smallest room becomes the object.

NOTE 3 :

The minimum indoor floor space compared with the amount of refrigerant is roughly as follows: (When the ceiling is 2.7 m high)

3. Installation Standards

3-3. Precautions for new refrigerant installation

1. Care regarding piping

1-1. There is no need to change piping and tube wall thickness. Use refrigerant pipes of the same wall thickness as R22.

Unit: mm

Type		0					
Copper tube	Outer diameter	6.35	9.52	12.7	15.88	19.05	22.2
	Wall thickness	0.8	0.8	0.8	1.0	1.0	1.2

Type		1/2 H, H						
Copper tube	Outer diameter	25.4	28.58	31.8	38.1	41.3	44.45	50.8
	Wall thickness	1.0	1.0	1.2	1.3	1.3	1.4	1.5

* C1220 type with JIS H 3300 designation (Copper Pipe and Copper Alloy Seamless Pipe)

1-2. Prevent impurities including water, dust and oxide from coming into the pipe. Impurities can cause R407C refrigerant deterioration and compressor defects. Due to the different features of the refrigerant and refrigerating machine oil, the prevention of water and other impurities becomes more important than ever.

2. Make sure to refill the refrigerant in liquid form.

2-1. Since R407C is a non-azeotrope, refilling the refrigerant in gas form can lower performance and cause defects of the unit.

2-2. Since refrigerant composition changes and performance decreases when gas leaks, collect the remaining refrigerant and refill the required total amount of new refrigerant after fixing the leak.

3. Different tools

3-1. Tools specs have been changed due to the features of R407C.

Some of the R22 tools cannot be used.

Product name	New tools	R22 tools compatible with R407C	Remarks
Gauge manifold	Yes	No	Types of refrigerant and refrigerating machine oil, and pressure gauge are different.
Charge hose	Yes	No	To resist pressure and oil, material has been changed.
Vacuum pump	Yes	Yes	Use a conventional vacuum pump if it is equipped with a check valve. If it has no check valve, purchase and attach a vacuum pump adaptor.
Leak detector	Yes	No	Leak detectors for CFC and HCFC which react to chlorine do not function because R407C contains no chlorine. Leak detector for R407C can be used for HFC134a.
Flaring oil	Yes	No	Mineral oil (for example, suniso oil) can be used as R22 oil. Use synthetic fluid (for example, ether oil) as R407C oil.

* Using both R22 tools and new tools together can cause defects.

3-2. Use a R407C exclusive cylinder only.

Gauge manifold

1202_C_1

Vacuum pump

1203_C_1

Valve

Single-outlet valve

(with siphon tube)

Liquid refrigerant can be refilled standing it up straight.

1171_M_1
TD831077

3. Installation Standards

3-4. New refrigerant R407C cannot be used for existing models

1. Compressor specs are different.

When refilling the R22 compressor with R407C, durability will significantly decrease since some of the materials used for compressor parts are different.

2. Existing piping cannot be used.

Completely cleaning out residual refrigerating machine oil is impossible, even by flushing.

3. Refrigerating machine oil differs.

Since R22 refrigerating machine oil is mineral oil, it does not dissolve in R407C. Therefore, refrigerating machine oil discharged from the compressor can cause compressor damage.

R22 refrigerating machine oil	Mineral oil (suniso oil)
R407C refrigerating machine oil	Synthetic fluid (ether oil)

1. Compressor Control

1-1. Compressor capacity control

(1) Outdoor unit operation control

- The compressor capacity is calculated by the C.C.U. based on the operation capacities of the indoor units and the difference between the temperature setting and room temperature. This is designated as the C.C.U. target capacity, and this is assigned to each outdoor unit as the outdoor unit target capacity.
- Priority is given to the PC unit for operation.
- To allow operation of the maximum number of outdoor units, the outdoor units may be re-selected in cases where the required operation capacity is 80% or more of the PC unit maximum operation capacity.
- In order to compensate for the capacity, compressors may operate at more than the indoor unit operation capacity in some cases.

(2) Relationship between current operation capacity and output

(Current operation capacity: Indicated as percentage with the maximum capacity being 100%)

① 150 type

Table 1

Output		Current operation capacity (%)								
		0	7	14	21	28	36	42	49	56
PC compressor	Magnet switch	OFF	ON	ON	ON	ON	ON	ON	ON	ON
	Low-pressure valve	ON	ON	ON	OFF	OFF	ON	ON	OFF	OFF
	High-pressure valve	OFF	OFF	OFF	ON	ON	OFF	OFF	ON	ON
AC compressor	Magnet switch	OFF	OFF	OFF	OFF	OFF	ON	ON	ON	ON
External save valve		ON	ON	OFF	ON	OFF	ON	OFF	ON	OFF

The scroll (SC) compressor magnet switch is turned on at 52% or more.

② 190 type

Table 2

Output		Current operation capacity (%)							
		0	60	68	74	82	88	96	100
PC compressor	Magnet switch	OFF	ON	ON	ON	ON	ON	ON	ON
	Low-pressure valve	ON	ON	OFF	OFF	ON	ON	OFF	OFF
	High-pressure valve	OFF	OFF	ON	ON	OFF	OFF	ON	ON
AC compressor	Magnet switch	OFF	OFF	OFF	OFF	ON	ON	ON	ON
External save valve		ON	OFF	ON	OFF	ON	OFF	ON	OFF

The compressor magnet switch is turned on at 11.5 H.P. or more.

(3) Startup delay for outdoor unit

When an operation start signal is received, the operation of each outdoor unit compressor is delayed by "outdoor address".

(4) Startup delay for AC and SC compressors in PC unit

If the outdoor unit target capacity is determined in the full stop state indicates that more than one compressor will be started at the same time, the SC compressor starts 15 seconds delayed from the AC compressor, and the AC compressor starts 15 seconds delayed from the PC compressor. However, the delay time is five seconds when using 4-way valve adjustment control, inter-system oil recovery control, and hot gas defrosting control.

(5) All outdoor unit compressors that have been stopped do not operate for three minutes.

* When the capacity is decreased from maximum capacity operation, the AC compressor is stopped, and then the SC compressor is stopped and the AC compressor is turned on again, operation is performed by the PC compressor only for the three minutes that the AC compressor is off.

(6) In the PC unit, if a compressor is started when another compressor is already operating, the high-pressure valve (HPV): OFF, low-pressure valve (LPV): ON, and save valve (SAVE): ON status is held for 15 seconds before starting the compressor.

(7) Increasing and reducing the operation capacity

When the outdoor target capacity is decreased, this immediately becomes the target capacity.

If the outdoor target capacity is increased, the target capacity either increases immediately to this capacity or it increases in 30-second steps depending on the increase amount.

2. Protection Controls

- If the C.C.U. target capacity decreases, the C.C.U. target capacity does not increase for one minute.
- If the outdoor unit capacity decreases, the capacity does not increase for one minute. However, the case in (6) under "1-1. Compressor capacity control" is an exception.

(1) Discharge temperature control

Discharge temperature control is determined based on the type of installed compressors regardless of the outdoor model.

① High discharge temperature

Table 3

PC unit (PC compressor, AC compressor)		PC unit (SC compressor), AD unit	
?	Compressor OFF	?	Compressor OFF
106 °C	Compressor ON	135 °C	Compressor ON

The outdoor unit is stopped when the protection mechanism of the PC compressor is activated.

The outdoor unit is stopped when the protection mechanism of the AD unit compressor is activated.

* After compressor operation, a warning is issued if operation is stopped four consecutive times after less than five minutes (less than two minutes for the scroll compressor) by the above control.

② Startup protection temperature

The compressors do not operate if the discharge temperature of the stopped compressors are higher than the temperatures in the table 4.

Table 4

PC unit (PC compressor, AC compressor)	PC unit (SC compressor), AD unit
90 °C	90 °C

③ Discharge temperature sensor error

A warning is issued if the discharge temperature is higher than the temperatures in the table 5 even when the compressor is stopped for 15 minutes.

Table 5

PC unit (PC compressor, AC compressor)	PC unit (SC compressor), AD unit
90 °C	90 °C

(2) Current control

Current control is determined based on the installed compressors regardless of the outdoor model.

① Lock current

A warning is issued if the current value of the compressors that are operating exceeds Ar.

② Overload current

A warning is issued if the current value of the compressors that are operating exceeds Ao for 30 seconds.

Table 6

Compressor capacity		Lock current	Overload current
		Ar	Ao
Rotary compressor	4 H.P.	33	27
	5 H.P.	36	30
Scroll compressor	8 H.P.	56	46
	10 H.P.	72	60

2. Protection Controls

(3) Coil temperature control

① Evaporation temperature control

The lowest of the E1, E2, and E3 temperatures of all indoor units whose cooling thermostat is on is designated as the minimum evaporation temperature (T_e), and control is performed as shown in the table 7. This control is performed every 30 seconds.

Table 7

T_e °C	
6	Increase in capacity is allowed
5 ↓ 2	Increase in capacity prohibited
1.5	Decrease in capacity

- If the evaporation temperature is less than 2°C and the thermostat is off, control of the operation capacity at the next startup may begin from the smallest capacity.
- If "test run" is selected for even one indoor unit when the indoor units are running under cooling operation, the unit is constantly set to "increase in capacity is allowed".
- Three minutes after the compressor is started, "decrease in capacity" is regarded as "increase in capacity prohibited".
- When "decrease in capacity" control is activated for the minimum capacity due to the evaporation temperature, this is handled as "increase in capacity prohibited" for six minutes, and the thermostat is not turned off.

② Condensation temperature control

The highest of the E1 and E2 temperatures of all indoor units whose heating thermostat is on is designated as the maximum condensation temperature (T_c), and control is performed as shown in the table 8. This control is performed every 30 seconds.

Table 8

T_c °C	
X	Thermostat off
55	Decrease in capacity
54 ↓ 50	Increase in capacity prohibited
49	Increase in capacity is allowed

NOTE

The thermostat off temperature X varies from 60°C to 64°C depending on whether operation was stopped by the protection control or other control mechanisms.

- If the condensation temperature becomes more than X°C and the thermostat is off, control of the operation capacity at the next startup may begin from the smallest capacity.
- When "decrease in capacity" control is activated for the minimum capacity due to the evaporation temperature, this is handled as "increase in capacity prohibited" for six minutes, and the thermostat is not turned off.
- If the condensation temperature X°C is reached, the thermostat remains off for at least three minutes.

(4) Demand control

Table 9

Demand input		Control description
Contact 1	Contact 2	
X	X	No limits (100%)
○	X	70% of the outdoor unit maximum capacity total
X	○	50% of the outdoor unit maximum capacity total
○	○	Number of outdoor units allowed to operate: 0; The command "3 minute OFF" = ON is sent to the indoor and outdoor units.

○: Input X: No input

3. Fan Control

(1) Outdoor fan mode

Table 10

[PC unit]

Mode	Fan No. 1	Fan No. 2
8	High	High
7	High	Medium
6	Medium	Medium
5	Medium	Low
4	Low	Low
3	High	Stop
2	Medium	Stop
1	Low	Stop
0	Stop	Stop

Table 11

[AD unit]

Mode	Fan
5	–
4	–
3	High
2	Medium
1	Low
0	Stop

* When fan No. 1 is set to Low, fan No. 2 cannot be set to High.

(2) Initial control

Control is performed during the initial 30-second operation starting period based on the external temperature as shown in the table below.

Table 12

During cooling operation		During heating operation	
External temperature °C		External temperature °C	
21	Fan mode: 8 (3)	21	Fan mode: 1~6 (2)
16	Fan mode: 4~8 (3)	16	Fan mode: 4~8 (3)
11	Fan mode: 2~6 (3)	11	Fan mode: 6~8 (3)
1	Fan mode: 1~4 (2)	10	Fan mode: 8 (3)
0	Fan mode: 1~3 (2)		

NOTE

The initial fan speed of PC unit may change based on the operation capacity of the outdoor unit.

The initial fan speed for the AD unit is shown in parentheses.

- (3) The fan mode can be moved up or down based on the operating status. However, fan mode No. 0 is not available during heating operation.
- (4) When the fans are started up, they run at High for 12 seconds.

4. Outdoor Electronic Expansion Valve

(1) When the outdoor unit is stopped: 0 pulses (initialized by stopping operation)

However, control is performed at 55 pulses in systems with only the AD unit if all of the units are stopped during cooling mode.

(2) During cooling operation : 480 pulses

(3) During heating operation : ΔT control at each heat exchanger

- ΔT =Gas temperature - liquid temperature
- The target ΔT is 3°C to 8°C (adjustable using the operation capacity)

The control range is 30 to 480 pulses.

5. Solenoid Valve Control

- In solenoid valve control, in addition to the conditions shown below, multiple valves may be controlled at the same time. This is performed according to the respective control items.

(1) Liquid valve control (LIVP, LIVA, LIVS)

To properly control the discharge temperature, control is performed on a small amount of liquid refrigerant bypassing to the suction pipe.

① High discharge temperature

Table 13

PC unit (PC compressor, AC compressor)	PC unit (SC compressor), AD unit
Rotary compressor	Scroll compressor
<p>Discharge temperature °C</p> <p>90</p> <p>70</p> <p>OFF</p> <p>ON</p> <p>1815_M_I</p>	<p>Discharge temperature °C</p> <p>118</p> <p>100</p> <p>95</p> <p>80</p> <p>OFF</p> <p>ON</p> <p>After five minutes</p> <p>Less than five minutes</p> <p>1816_M_I</p>

* The discharge temperature of the scroll compressor changes the line diagram for after five minutes and less than five minutes after compressor startup.

(2) Save valve control (PC unit only) (SAVE)

- ① Save valve control is turned on according to the compressor control items.
- ② Save valve control is turned on for five minutes after stopping the outdoor unit.
- ③ Save valve control may be turned on due to other control mechanisms (4-way valve adjustment control, hot gas defrosting control).

(3) Hot gas valve (DEF)

- ① Hot gas valve control is on during hot gas defrosting control. Also, hot gas valve control remains on for 10 seconds after hot gas defrosting control is finished.
- ② Hot gas valve control remains off in situations besides (1) above.

NOTE

Hot gas defrosting is performed simultaneously with hot gas valve control, but they end separately.

(4) Refrigerant adjustment valve control (REV)

- ① Valve control is off when operation is stopped.
- ② Valve control is turned on or off according to whether a shortage of refrigerant or overcharge is detected.

(5) Oil recovery valve control (ORVR)

- ① See the oil recovery control and refrigerant movement control items.
- ② Valve control of PC unit may be turned on when the compressor is operating during heating. This helps to even out any low pressure in the operating units by passing through the balance pipes. (The balance pipes are low pressure.) Priority is given to oil control.

(6) Bypass valve control (BPV)

- ① See the oil recovery control and refrigerant movement control items.
- ② The AD unit may be turned on when the compressor is operating during cooling. Some of the refrigerant passes through the balance pipe and bypasses to the PC unit. (The balance pipe is high pressure.) Priority is given to oil control.

(7) Balance valve control (BRV)

- ① See the oil recovery control and refrigerant movement control items.

5. Solenoid Valve Control

(8) PC oil valve control (OILP), SC oil valve control (OILS)

There is no oil sensor in the AC compressor due to cross oil control. As a result, no oil valve is attached.

Oil is constantly returning to the AC compressor by passing through a capillary tube.

- ① When self-separator oil recovery is performed
 - The oil valve of the operating compressor not having enough oil is turned on.
- ② When involved in inter-unit oil recovery control
 - When supplying oil to other units: Both the PC oil valve and SC oil valve are turned off.
 - When oil is received from other units: The oil valve of the compressor not having enough oil is turned on.
- ③ Other items
 - The oil valve for compressors that are stopped are turned off. However, both valves are turned on for five minutes after the outdoor unit is stopped in order to obtain balanced pressure.
 - The oil valve of the compressor not having enough oil is turned on, and the oil valve of the compressor having enough oil is turned off.
 - When the AC compressor is operating, the oil valve is turned off if there is enough oil in the corresponding compressor.
 - When the AC compressor is stopped, the oil valve of the compressor that is operating is turned on.

(9) 4-way valve control (20S)

- ① During normal operation, 4-way valve control is turned off during cooling operation and turned on during heating operation. (The output status for all outdoor units is the same.)
- ② When an outdoor unit is stopped, the mode just before stopping is maintained.

6. Hot Gas Defrosting Control

- Hot gas defrosting using a normal cycle is performed.
- Defrosting is performing by using some discharge gas to bypass to the distributor of the outdoor heat exchanger.

6-1. Frost detection

- (1) Frost detection is not performed for five minutes from the start of operation.
- (2) Frost detection conditions = Condition 1 or Condition 2
 Condition 1 = L2 line or below for four continuous minutes is detected twice
 Condition 2 = L1 line or below detected for a total of 60 minutes

Fig. 1
VI - 7

1814_M_1

TD831077

6. Hot Gas Defrosting Control

6-2. Defrosting operation conditions

- (1) Defrosting operation is performed after at least 35 minutes of total operation during heating operation.
 - * Even in outdoor units where a total operation time of 35 minutes has not elapsed, defrosting operation will be performed if other outdoor units satisfying the conditions above start defrosting operation.
- (2) Once defrosting operation is finished, defrosting operation does not start again for 10 minutes (even when operation is stopped while defrosting is in progress).
- (3) If the CHECK. PIN (CP) on the outdoor unit control P.C.B is short-circuited during operation, the defrosting operation conditions are met, and defrosting operation is forced to start. However, defrosting operation is not performed for the 10 minutes described in (2) above. Also, be sure to remove the CHECK. PIN (CP) if this operation has been performed.

6-3. Defrosting end conditions

- (1) Minimum temperature of the sensor mounted to the outdoor unit heat exchanger must be $\geq 6^{\circ}\text{C}$
- (2) Maximum of 12 minutes

6-4. Defrosting control description

Table 14

Control units	Control unit operation during defrosting operation	
	During hot gas defrosting operation (maximum of 12 minutes)	After defrosting operation
Hot gas valve	ON	OFF
Constant-speed compressor	Maximum capacity (protection control priority)	
LPV		
HPV		
Save valve	ON	Normal control
4-way valve	ON	ON
Outdoor fan	Stop	Normal control
Refrigerant adjustment valve	ON	Normal control
Outdoor electronic expansion valve	Control at 80 to 250 pulses	Normal control

NOTE

The target maximum capacity of all operating outdoor units is transmitted during defrosting control.

7. Self-Separator Oil Recovery Control

- Control is performed for oil recovery from the oil separator of the unit itself. The recovery valve and balance valve are turned on at the same time.

8. Inter-Outdoor Unit Oil Recovery Control

- Control is performed on oil exchanges (supplying and receiving) with other outdoor units by passing through the balance pipes. However, this control is only performed when multiple outdoor units are operating. This control is performed when the oil of compressor does not return to the original level after self-separator oil recovery is performed.
- Oil-supplying unit : The balance valve and bypass valve turn on and off alternately.
- Oil-receiving unit : The recovery valve is turned on.
 - * The balance valve is set to high and low pressure by the turning on and off of the balance valve and bypass valve.

9. Inter-Refrigerant System Oil Recovery Control

- Control is performed for recovering the oil accumulated in the indoor unit, refrigerant pipes, or other locations in the system. (maximum of two minutes)
- **Control description**
- If the oil does not return to the original level even after the oil level reaches 0 and operation is performed for a set time, the thermostat for the outdoor unit is turned off. Operation is then restarted, and this control is started if the oil level does not rise above 1 when this operation is performed and stopped three times.
 - * During operation, the self-separator oil recovery control and inter-outdoor unit oil recovery control are performed simultaneously.
- If the PC compressor oil level is 1 or less when the AC compressor is turned on, and the PC compressor oil level does not reach 2 by performing self-separator oil recovery control and inter-outdoor unit oil recovery control, the AC compressor is stopped, and the PC compressor operates at the maximum capacity. When this state continues for 30 minutes or more, inter-refrigerant system oil recovery control is started.
- When all connected outdoor units are operating at the maximum capacity, the indoor unit electronic expansion valve runs at the initial pulse for the cooling cycle and 480 pulses (fully open) for the heating cycle.
- During inter-refrigerant system oil recovery control, self-separator oil recovery control and inter-outdoor unit oil recovery control is performed simultaneously based on the conditions. However, the count is not cleared unless the oil level reaches 2.
- After inter-refrigerant system oil recovery control, normal control is performed. However, if the oil level becomes 0 without reaching 2, operation is stopped after a set time, and a warning is issued.

10. 4-way Valve Adjustment Valve

- When the power is turned on, a warning is issued, or at least one hour has passed in a fully stopped state, control is performed for unifying the 4-way valve modes of all the outdoor units and for recovering refrigerant accumulated in the pipes.
 - * **Cooling operation** :
 - All of the outdoor units operate at the maximum capacity for one minute.
 - The opening and closing of the indoor unit electronic expansion valve is the initial pulse regardless of the unit operation/stopping.
 - * **Heating operation** :
 - All of the outdoor units operate at the maximum capacity for 1 to 10 minutes. When this control is started, only the outdoor unit that must operate runs at the maximum capacity in response to the indoor unit capacity request. However, this operation is not performed when the power is turned on and after a warning is issued.
 - This control is performed for a minimum of one minute, and it ends when the maximum condensation temperature is 35°C or above.

11. Refrigerant Movement Control

- Refrigerant passes through the balance pipes and is recovered from the stopped unit when shortage of refrigerant is occurred during operation. However, priority is given to the various types of oil control.
 - * **During cooling operation** :
 - Operation unit : The recovery valve is turned on.
 - Stop unit : The bypass valve and balance valve are turned on.
 - * **During heating operation** :
 - Operation unit : The recovery valve is turned on.
 - Stop unit : The balance valve is turned on, and the outdoor fan operates at the maximum speed.

12. Backup Operation

● Types of backup operation

(1) Electrically disconnecting a unit

- ① Disconnect the inter-control unit wire from the faulty outdoor unit, and set the number of C.C.U. AD units to the number of outdoor units that are connected electrically minus one.
- ② Close the service valve of the faulty unit.
- ③ In this state, perform operation to check the operating status.
 - This completes the procedure.
 - If the PC unit is faulty, leave the power on for the C.C.U. If the PC unit is electrically disconnected, operation is not performed unless a request with a capacity of one or more AD units is received from the indoor unit.
- ④ Settings for allowing backup operation
 - Change the settings of the C.C.U. DIP switch S6.

Example : When three outdoor units are installed

Example 1 : When there is one PC unit and one AD unit (one AD unit is faulty)

← Set to the number of outdoor units that are connected minus one. In this example 2-1=1.

Example 2 : When there are two AD units (PC unit is faulty)

← Set to the number of outdoor units that are connected minus one. In this example 2-1=1.

(2) Backup operation when a compressor in the PC unit is faulty

- Backup operation using only the PC unit is still possible when one of the PC unit compressors is faulty.
- ① Setting the backup switch and CT switch combinations on the outdoor unit control P.C.B. allows operation while ignoring the protection control mechanisms of the faulty compressor.

NOTE

 - 1) Backup operation is an emergency measure in the event of a fault.
 - 2) The settings on the C.C.U. do not need to be changed.
 - ② Settings for allowing backup operation

Change the settings of the PC unit outdoor unit control P.C.B. DIP switch S1.

Example 1 : When the AC compressor is faulty

→ Set 2: CTA and 4:BUSW to ON.

Example 2 : When the SC compressor is faulty

→ Set 3: CTS and 4:BUSW to ON.

Example 3 : Backup operation is possible when the PC compressor is faulty.

→ Set 1: CTP and 4:BUSW to ON.

* Since the discharge pipe of the PC compressor does not have a check valve, check that the discharge refrigerant for other compressor is not bypassed to the low-pressure side. If refrigerant has bypassed to the low-pressure side, remove the PC compressor, close the discharge and suction pipes with pinches, and perform emergency operation.

13. Room Temperature Control

The thermostat is switched on/off by ΔT as follows.

$\Delta T = (\text{Room temperature}) - (\text{Set temperature})$	
Remote control sensor	Room temperature = remote control sensor detection temperature
Body sensor	Room temperature = (Body sensor detection temperature) - (Air-intake shift temperature*)

* Shift temperature (valid only for heating)

In heating mode, a temperature difference occurs between the upper part and lower part of a room. The value is set in consideration of the difference between the temperature detected by the body sensor located in the upper part of the room and the temperature detected in the lower part of the room.

0 °C ~ 10 °C can be selected with the remote controller simple setting mode.

(Factory settings: floor standing type ----- 0 deg; wall-mounted type ----- 2 deg; other types ----- 4 deg)

Supplement:

- (1) After thermo-on, it will not thermo-off for 3 minutes due to ΔT .
However, for heating, if the indoor coil E2 temperature ≥ 64 °C, it will thermo-off within 3 minutes (over load protection).
- (2) After thermo-off, it will not thermo-on for 1~3 minute.
For cooling or dehumidifying, it will not thermo-on if the indoor coil E1 or E2 temperature < 6 °C even after the above-mentioned period of time has passed.
- (3) When the system is set for test operation, it will not thermo-off for 60 minutes (forced thermo-on).

14. Auto. Mode for Automatic Heating/Cooling Switching

Chart summary and Explanations

- This control is effective only for one indoor unit or group control.
- (1) This chart shows how the Operation Mode (**COOLING** or **HEATING**) is determined by the microprocessor taking the room temperature into consideration. It also shows the temperature points at which the cooling or heating mode is switched, when the AUTO mode is selected.
 - (2) After operation starts, the set temperature shifts automatically by +2 deg. at cooling and by - 2 deg. at heating. For example, if cooling is selected, the set temperature changes from 20° C to 22° C.
(The display of the remote controller remains 20° C.)
 - (3) The change of the operation mode (heating to cooling, cooling to heating) by the change of the room temperature during the operation is as follows.
 Heating to Cooling; Room temp. \geq Shifted temp + 0.5 deg.
 Cooling to Heating; Room temp. \leq Shifted temp -1.0deg.
 For example, if the room temperature rises above 22.5 °C (=22+0.5) during the cooling operation at the room temperature 20° C set by the remote controller, the operation changes to cooling. When the room temperature lowers below 17° C (=18-1.0) thereafter, the operation changes to heating again.
 - (4) In heating operation, using the body sensor, room temperature control is designed so that room air temp. is sensed as 4 deg. lower than suctioned air at indoor unit taking into account of the temperature gap between upper part and lower part of the room. Accordingly, in this example, when the body sensor detection temperature reaches more than 26.5 °C, the operation is changed from heating to cooling.
 - (5) Within 10 minutes after the compressor turns OFF, the operation does not change to cooling (heating), even when the room temperature changes from C to A (A to C).
 - (6) When switching from cooling (heating) to heating (cooling), the actuation of the 4 way valve will delay about 30-50 seconds after the compressor turns ON.

15. Heating Preparations

(1) After thermo.-on, until the set fan speed is reached, cool air is output (emanates) from this beginning heating operation and the indoor fan speed is controlled as shown below to prevent cold draft.

- When the fan speed is LL or off, "STAND BY" is displayed at the remote controller.
 - Room temperature thermostat off
 - Condensation elimination operation
 - After heating operation start, until the indoor coil E2 temperature is 27 °C or higher (6 minutes max.)
- After heating operation start, the fan speed approaches the set fan speed as the indoor coil E2 temperature rises.

H: High L : Low
M: Middle LL: Very low

- * Same for automatic fan speed setting
- The dotted lines are fan off. (When the indoor coil E2 temperature is 20°C or lower, the fan does not operate.)

0322_M_1

(2) Fan speed control after set fan speed is reached

- Indoor coil E2 temperature ≥ 43 °C, the control below is performed.
- Indoor coil E2 temperature ≤ 38 °C, until indoor coil E2 temperature ≥ 43 °C, the fan speed accelerates in a rising slope.
- When the fan speed changes, it does not change again for 1 minute.

H: High L : Low
M: Middle LL: Very low

0323_M_1

16. Dehumidifying Control

1268_M_I

17. Automatic Fan Speed Control

- (1) When automatic fan speed is selected with the remote controller, the indoor fan motor is controlled as shown below.
- (2) The fan speed does not change in 3 minutes of cooling operation and in one minute of heating operation after operation starts.

17-1. Cooling

H : High L : Low
 M : Middle LL : Very low

0324_M_I

17-2. Heating

H : High L : Low
 M : Middle LL : Very low

0325_M_I

6

18. Auto-flap Control

18-1. X, S, T Type

The auto-flap controls the air flow to one of the five vertical levels.

X type (4-way), S type (2-way)

T type

1267_M_1

Operation mode	Flap position	
	Automatic setting	Manual setting
Cooling / drying	F2	F1 · F2 · F3 · swing
Fan	F2	F1 · F2 · F3 · F4 · F5 · swing
Heating	F4	F1 · F2 · F3 · F4 · F5 · swing
Heating preparation	F2 (Original position after release)	

- (1) When the unit is stopped, the auto-flap returns to the F5 position.
- (2) When the airflow direction is set manually (optional setting), the auto and swing settings will be released. To return to automatic airflow direction, change the operation mode.
- (3) Once auto-flap is set, it is input into the microcomputer memory.
- (4) When the operation mode is changed, the unit begins a sensing operation. (If a search for sensing points does not succeed in one minute, only the flap moves.)

Remote controller configuration	Wired remote controller (RCS-SH80TG)		Wireless remote controller (RCS-SH80TGWL)		System controller (SHA-KC64TG)
	Single	Group control	Single	Group control	
Auto-flap					
Swing	○	○	○	○	△ (*1)
Air direction setting	○	○	○	○	△ (*1)

*1: Only possible when remote control unit is not used.
For group control, the settings are for the complete group.

18-2. K Type

When the "SWEEP" button is pressed, swing starts and when it is pressed again, the flap stops in place.

19. Drain Pump Control (Does not include K, T, D, F, FM Type)

- (1) Drain pump control turns ON when the compressor is activated in cooling operation.
- (2) When the compressor turns OFF due to freeze prevention control, drain pump turns ON for 20 minutes.
- (3) Drain pump control turns ON when the floating switch is activated. If the operation is performed for 5 minutes and the floating switch does not return to the original position, an alarm message P10 is displayed. (Operation continues.)

If the floating switch returns to the original position, control turns OFF 5 minutes after the return of the floating switch.

20. Indoor Electronic Expansion Valve

- However, when the compressor is stopped, there still occur 20 pulses. When the power is first switched on until the ON / OFF operation button is pressed, the valve is open at 480 pulses.
- From then on, control is accomplished as shown below.

20-1. Cooling and dehumidifying operation

- (1) When operation is stopped and thermo-off, operation is still at 20 pulses. However, the electronic expansion valve may be opened for about 3 minutes to recover oil in the pipes.
- (2) When the thermostat is active, the valve is controlled in the range of 70 to 480 pulses.
- (3) When the compressor maximum discharge temperature ≥ 98 °C, the degree of electronic expansion valve opening increases.
- (4) When the super-heat of indoor unit (E3 temperature – E1 temperature) is low, the degree of electronic expansion valve opening is reduced. However, (3) has priority.
- (5) When the super-heat at the indoor unit outlet is high, the degree of the electronic expansion valve opening increases.

20-2. Heating operation

- (1) When operation is stopped and the thermostat is inactive, the electronic expansion valve opens and closes so that the refrigerant does not accumulate excessively in the indoor unit.
- (2) When thermo-on, the valve is controlled within the range of 70 to 480 pulses.
- (3) When the compressor maximum discharge temperature ≥ 98 °C, the degree of electronic expansion valve opening.
- (4) When the degree of heat at the outdoor heat exchanger (coil temperature – liquid temperature) is high, the degree of electronic expansion valve opening increases.
- (5) When the sub-cool of indoor unit (E2 temperature – E1 temperature) is low, the degree of electronic expansion valve opening reduces. However, (4) above takes precedence.
- (6) When the degree of overcooling at the indoor unit outlet (E2 temperature – E1 temperature) is high, the degree of electronic expansion valve opening is increased.
- (7) When the indoor heat exchanger temperature ≤ 30 °C, the electronic expansion valve returns to its initial pulse control.

21. Discharge Temperature Control (Only for U, D Type)

- If the range shown below is continuously detected for 6 minutes, the unit will thermo-off operation is initiated.

- *1. The discharge temperature was factory set as follows: 15 °C for cooling; 40 °C for heating
This can be changed using the simple setting mode on the remote controller.
2. For U and D type, thermo-off operation is initiated if one of the thermo-off conditions for normal room temperature control and the discharge temperature control is met.

22. Automatic Restart Function after Power Failure

Even when power failure occurs, preset programmed operation can be reactivated once power is resumes within 100 hrs.

23. Filter Sign

Filter sign informs you when maintenance is necessary.

- 2,500 hrs : X, S, T, SL, type
- 150 hrs : AS, K, F, FM type

 - 2-1. Refrigerant recovery when a fault occurs in the indoor unit VII - 17
 - 2-2. Refrigerant Recovery Operation VII - 18

1. Compressors

Compressor trouble can generally be grouped under the following categories:

- ① Mechanical trouble → (A) Compressor lock-up
(B) Trouble in boosting pressure
(C) Abnormal noises
- ② Electrical trouble → (A) Winding burn-out
(B) Broken or disconnected wires
(C) Defective insulation
(D) Ground faults

Troubleshooting consists in pinpointing the trouble from the winding resistance (which differs depending on the compressor concerned), insulation resistance, current, leakage circuit breaker tripping, extent to which the oil and refrigerant have become contaminated, abnormal smells, pressure, noise and other factors on the basis of the H01 and H02 (PC comp), H11 and H12 (AC comp), H21 and H22 (SC comp) remote control displays.

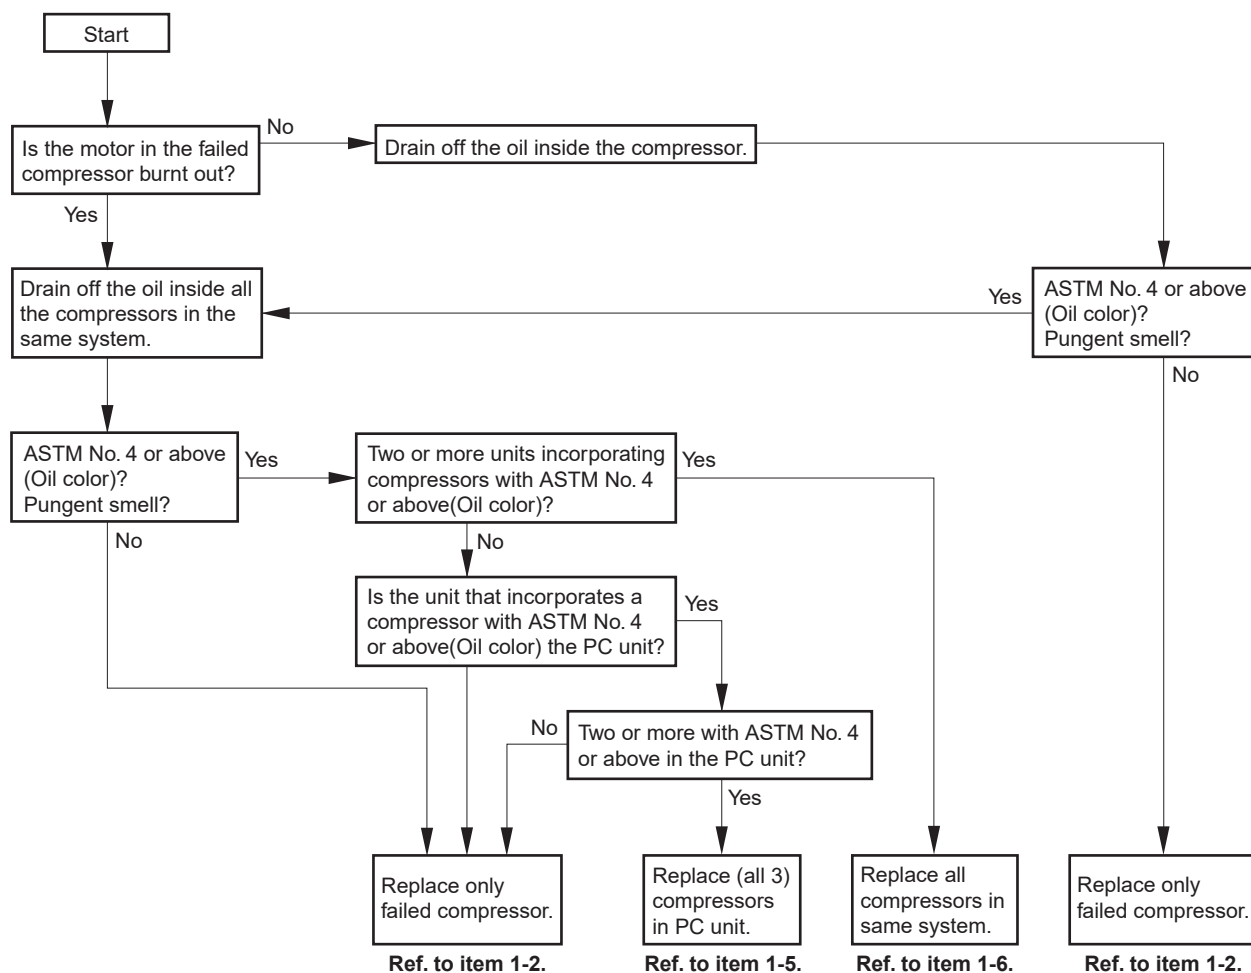

Remarks: Insulation resistance (measure the insulation resistance of the live parts and non-live parts using a DC 500V megger)

(a) Fan motor → 300 Ω or more

(b) compressor → 100 Ω or more (item supplied for servicing)

(c) unit → 10 Ω or more (this is measured because the unit contains refrigerant which reduces the insulation resistance)

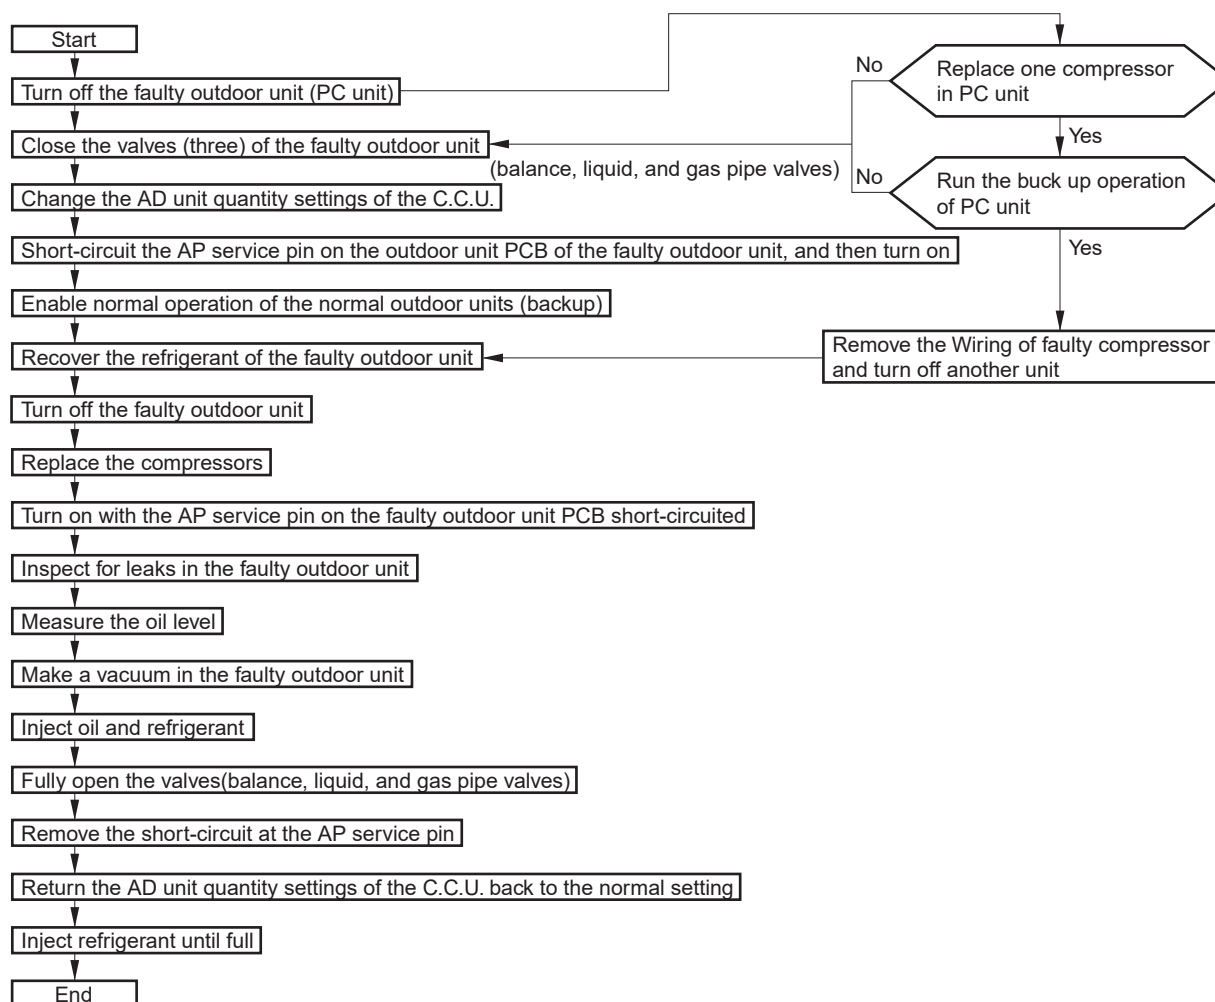

1-1. Judging whether a compressor needs to be replaced

1867_M_I

1. Compressors

1-2. Procedure for Replacing one faulty Compressor

1883_M_1

NOTE

1. Ref. P VI-10, Backup Operation, under Control Functions.
2. When the AP service pin is short-circuited, the compressors and fans of the faulty unit (PC unit) are stopped, the solenoid valves and electronic expansion valves are fully opened, and all transmission is stopped.
3. Be sure to first check the injection amount of the refrigerant and oil, and then check the recovery amount.
4. If the short-circuit of the AP service pin is removed when the power is left on, transmission with the C.C.U. is restarted.
5. Even if an alarm (E26) has occurred, operation is restarted when the unit quantity setting is returned to normal. The power does not need to be turned on and off again.
6. Perform immediately once the oil and refrigerant are injected.
7. Perform this operation if you were unable to inject the specified amount using the normal injection procedure.

1. Compressors

(1) Refrigerant Recovery and Oil Recovery of the Faulty Unit (Always use the refrigerant recovery device)

Dirty oil and refrigerant from the faulty unit must not be recovered in another unit. Use the following procedure to correctly perform refrigerant and oil recovery. Also, be sure to connect the dry core (D-253U) in accordance with Fig. A (P19).

- 1. Perform an air purge for each service pipe. (Do not release the refrigerant into the open air.)**
Install a manual valve (packless valve) near the connected piping discharge outlet, and then perform an air purge for the piping up to the valve. Use a vacuum pump to air purge with a vacuum pump up to 133.3 Pa (1 mmHg) in the connected main piping. Also, air purge with a vacuum pump inside the oil separator.
- 2. Set the valves.**
Open valves V1 and V5, and close the other valves V2, V3, V4, V6, V7, V8, and V9. (The supplied valves of the oil tank and oil separator are all closed.)
- 3. Operate the refrigerant recovery device, and recover the dirty refrigerant.**
* For information about refrigerant recovery device operation, refer to the operation manual of the respective device. Prepare a cylinder with a capacity of at least 15 kg.
- 4. Look at the site glass, and perform the valve operations below to recover the oil if the liquid refrigerant becomes low.**
 - a) Close the valves of the balance pipes (① valve).
 - b) Set the balance pipe valve ② of the faulty outdoor unit from closed to the half-way open (turn about two times).
 - c) Perform operations on the valves installed at the site. Open the V2 and V4 oil separator valves, and set the V1 valve from open to closed. (Oil recovery is started.)
 - d) When approximately 10 minutes elapses, turn valve V1 from closed to open, and then operate until the low-pressure switch of the refrigerant recovery device is activated.
(Perform refrigerant and oil recovery until the internal pressure of the faulty unit is 0.098 MPa (1 kg/cm²) or lower. If the dry core is clogged with dirt or other debris, replace it with a new one.)
- 5. Stop operation of the refrigerant recovery device.**
- 6. Close the V5 valve, and then open the V9 valve to release the small amount of residual gas refrigerant into a safe location. Check that the vacuum low-pressure gauge becomes 0 MPa (0 kg/cm²).**
- 7. When these operations are finished, remove the circuits for the oil separator, dry core, and V4 valve.**
- 8. Measure the amount of recovered refrigerant and oil. (This amount of refrigerant and oil will be added later.)**
- 9. Never attempt to reuse recovered refrigerant or oil. Dispose of the recovered refrigerant and oil at a recycling plant.**

1. Compressors

1-3. PC unit

(1) Replacing the power control (PC) compressor (Ref. Fig. 1)

[Removal]

1. Remove the front panel at the front.
2. Remove the sound-proofing material which is wrapped around the compressor.
3. Remove the cap over the compressor terminal section, and disconnect the power and internal terminals. (Do this in two places at the left and right.)
4. Remove the crankcase heater.
5. Disconnect the oil sensor leads from the PCB.
6. Remove the three bolts.
7. Prepare to remove the welded areas. (Protect the sensor unit and the plate, rubber, leads and clampers around it.)
8. Remove the three welded areas and disconnect the connecting parts. If area (A) proves hard to remove, cut the pipe shown in the figure, and then remove.
9. Draw the compressor out toward you.

[Installation]

1. Prepare to install the compressor.
 - Remove the oil sensor and PC pipe from the failed compressor.
To return the oil inside the oil sensor to the compressor, tilt the compressor toward the opposite side to that of the oil sensor, and then close the ball valve.
Remove the upper and lower flare nuts.
 - Remove the stoppers over the outlet and intake ports of the new compressor.
 - Mount the oil sensor and PC pipe on the new compressor. After installing the oil sensor, be absolutely sure to open the ball valve.
 - Mount the flare nuts and other parts which were removed from the new compressor onto the failed compressor.
2. Install the compressor in the outdoor unit.
(Be absolutely sure to check the compressor's model number. The PC compressor is on the left. Its model number has the suffix "S or U".)
3. Install the pipes.
4. Replace the air inside the pipes with nitrogen.
(If the pipes have not been inserted, discharge a small amount of the nitrogen while using a burner to apply heat to them, and insert. Use wet cloths or other suitable materials to cool off the surrounding pipes.)
5. Braze with copper.

Fig. 1

1868_M_1

1. Compressors

- Close valve V9 and open valve V6 and inspect for leaks. (Keep the pressure within the 1.27 to 1.47 MPa (13-15 kg/cm²) range in order to protect the low-pressure switch.) (Ref. Fig. A)
Under no circumstances, do not exceed pressure 1.47 MPa (15 kg/cm²). Otherwise the low-pressure switch becomes damage.

NOTE

When the refrigerant has been recovered in the PC unit, inspect for leaks using a refrigerant gas pressure of 0.98 MPa (10 kg/cm²).

- If no leaks are found, close valve V6 and open valve V9, and prepare for establishing a vacuum. Mount the parts which were removed at the previous stage. (Ref. Fig. A)

(2) Replacing the constant-speed AC compressor (Ref. Fig. 2)

- * If the power cable interferes and makes it impossible to replace the AC compressor, refer to "(1) Replacing the PC compressor" on the previous page.

[Removal]

- Remove the front panel at the front.
- Remove the sound-proofing material which is wrapped around the compressor.
- Remove the cap over the compressor terminal section, and disconnect the power and internal terminals. (Do this in two places at the left and right.)
- Remove the crankcase heater.
- Remove the three bolts.
- Prepare to remove the welded areas.
 - Protect the sensor unit and the plate, rubber, leads and claspers around it.
- Remove the three welded areas.
- Lift and draw the compressor out toward you.

[Installation]

- Prepare to install the compressor.
 - Remove the cross oil pipe from the failed compressor. Before removing the pipe, tilt the compressor toward the opposite side to that of the cross oil pipe to return the oil inside the cross oil pipe to the compressor.
 - Remove the stoppers over the outlet and intake ports of the new compressor. Mount the crankcase heater.
 - Place the compressor on its side, and attach the cross oil pipe. Remove the upper flare nut. Loosen the lower flare nut, hold the cross oil pipe and connect it as quickly as possible. (Have a pan ready.)
 - Mount the flare nuts and other parts which were removed from the new compressor onto the failed compressor.
- Install the compressor in the outdoor unit.
(Be absolutely sure to check the compressor's model number. The AC compressor's model number has the suffix "B" or "C".)
- Install the pipes.
- Replace the air inside the pipes with nitrogen. (If the pipes have not been inserted, discharge a small amount of the nitrogen while using a burner to apply heat to them, and insert. Use wet cloths or other suitable materials to cool off the surrounding pipes.)

Fig. 2

1869_M_1

1. Compressors

5. Braze with copper.
6. Close valve V9 and open valve V6 and inspect for leaks. (Keep the pressure within the 1.27 to 1.47 MPa (13-15 kg/cm²) range in order to protect the low-pressure switch.) (Ref. Fig. A)

Under no circumstances do not exceed pressure 1.47 MPa (15 kg/cm²).

NOTE

When the refrigerant has been recovered in the PC unit, inspect for leaks using a refrigerant gas pressure of 0.98 MPa (10 kg/cm²).

7. If no leaks are found, close valve V6 and open valve V9, and prepare for establishing a vacuum. Mount the parts which were removed at the previous stage. (Ref. Fig. A)

NOTE

If the power cable was disconnected, perform the work in such a way that the power supply area screws will not become loose.

(3) Replacing the scroll (SC) compressor (PC unit) (Ref. Fig. 3, 4)

[Removal]

* Refer to "(1) Replacing the PC compressor" on page 5 to remove this compressor before following the steps in the procedure below.

1. Remove the front left side fan guard.
2. Remove the fan.
3. Remove the outer rear panel.
4. Remove the part of the compressor cover.
 - Left rear side panel, low-pressure switch.
 - * Remove the rear service panel of the compressor cover.
 - * Proceed with the work inside the fan nozzle area.
5. Remove the sound-proofing material which is wrapped around the compressor.
6. Remove the cap over the compressor terminal section, and disconnect the power and internal terminals.
7. Remove the crankcase heater.
8. Disconnect the oil sensor lead wires from the PCB.
9. Draw out the discharge sensor at the top of the compressor.

(Draw out the resin stopper.)
10. Remove the bolts and nut with washer.

Fig. 3

Fig. 4

1. Compressors

11. Proceed as instructed below to check whether any oil has accumulated in the suction pipe.
 - Loosen the lower flare part of the oil sensor, and drain off the oil until no more comes out. (Be absolutely sure to provide a pan large enough to collect about a liter of oil.)
 - Remove the oil sensor.
 - Place the cap over the installation hole of the oil sensor.

12. Prepare to remove the welded areas.
 - Protect the plate, rubber, leads and clampers around these areas.

13. Remove the three welded areas.

NOTE

Do not perform the work inside the unit when the discharge and suction pipes are to be disconnected.

14. Lift and draw the compressor out toward you.

[Installation]

1. Prepare to install the compressor. (Ref. Fig. 4)
 - Remove the stoppers over the outlet and intake ports of the new compressor.
 - Mount the oil sensor onto the compressor.
 - Connect the oil return pipe to the compressor.
 - Mount the flare nuts and other parts which were removed from the new compressor onto the failed compressor.
2. Install the compressor in the outdoor unit. (Be absolutely sure to check the compressor's model number.)
3. Shape the pipes and insert them into the welded areas.
4. Replace the air inside the pipes with nitrogen. (If the pipes have not been inserted, discharge a small amount of the nitrogen while using a burner to apply heat to them, and insert. Use wet cloths or other suitable materials to cool off the surrounding pipes.)
5. Braze with silver (in two places: discharge pipe and suction pipe). Braze with copper (in one place). Remove the paint, oil and other foreign matter from the silver brazing areas. Failure to do this may cause leaks.
6. Close valve V9 and open valve V6 and inspect for leaks. (Keep the pressure within the 1.27 to 1.47 MPa (13-15 kg/cm²) range in order to protect the low-pressure switch.) (Ref. Fig. A)
Under no circumstances do not exceed pressure 1.47 MPa (15 kg/cm²).
7. Close valve V6 and open valve V9, and prepare for establishing a vacuum.
8. In the silver brazing areas, remove the flux, and touch up the paint-work. (Ref. Fig. A)

NOTE

Be absolutely sure to attach the discharge sensor.

1. Compressors

1-4. AD unit

(1) Replacing the compressor (Ref. Fig. 5, 6)

[Removal]

1. Remove the front panel.
2. Remove the electrical parts box.
3. Remove the part of the compressor cover.
 - Disconnect the wires bundled together by the clumper.
4. Remove the sound-proofing material which is wrapped around the compressor.
5. Remove the cap over the compressor terminal section, and disconnect the power and internal terminals.
6. Remove the crankcase heater.
7. Disconnect the oil sensor lead wires from the PCB.
8. Draw out the discharge sensor at the top of the compressor.
(Draw out the resin stopper.)
9. Remove the nuts with washers.
10. Proceed as instructed below to remove the oil from the suction pipe.
 - Remove the upper pipe flare of the oil sensor. If oil oozes out, drain it off until no more comes out. (Provide a pan to collect the oil.)
 - After checking the above work, tilt the compressor, remove the lower pipe flare of the oil sensor, and then remove the oil sensor itself. (The oil which was in the oil sensor will ooze out at this point.)
 - Adjust the angle of tilt, and drain off the liter or so of oil inside the compressor. (It is OK if no oil comes out.)
 - Place the cap over the installation hole of the oil sensor.
11. Prepare to remove the welded areas.
 - Protect the plate, rubber, leads and clumpers around these areas.
12. Remove the three welded areas.
13. Lift and draw the compressor out toward you.

Fig. 5

Fig. 6

1. Compressors

[Installation]

1. Prepare to install the compressor.
 - Remove the crankcase heater.
 - Remove the compressor. Nuts with washers
 - Install the new compressor. Install it in the same status that the old compressor was originally in.
 - Remove the stoppers over the outlet and intake ports of the new compressor.
 - Install the crankcase heater.
 - Mount the oil sensor onto the new compressor.
 - Mount the flare nuts and other parts which were removed from the new compressor onto the failed compressor.
2. Install the compressor in the outdoor unit. (Be absolutely sure to check the compressor's model number.)
3. Shape the pipes and insert them into the welded areas.
4. Replace the air inside the pipes with nitrogen. (If the pipes have not been inserted, discharge a small amount of the nitrogen while using a burner to apply heat to them, and insert. Use wet cloths or other suitable materials to cool off the surrounding pipes.)
5. Braze with silver (in two places: discharge pipe and suction pipe). Braze with copper (in one place). Remove the paint, oil and other foreign matter from the silver brazing areas. Failure to do this may cause leaks.
6. Close valve V9 and open valve V6, and inspect for leaks. (Keep the pressure within the 1.27 to 1.47 MPa (13-15 kg/cm²) range in order to protect the low-pressure switch.) (Ref. Fig. A)
Under no circumstances must the pressure exceed 1.47 MPa (15 kg/cm²).
7. Close valve V6 and open valve V9, and prepare for establishing a vacuum. (Ref. Fig. A)
8. In the silver brazing areas, remove the flux, and touch up the paint-work.

NOTE

Be absolutely sure to attach the discharge sensor.

7

1. Compressors

(2) Air Purging with a Vacuum Pump, refilling the oil/refrigerant

[Measuring the amount of oil]

Measure the amount of oil in the compressor which has been removed and determine whether more oil needs to be added.

(a) When the oil inside the oil separator is not recovered	Total amount of oil recovered (liters)	-	1.8 l (AD COMP) 2.4 l (SC COMP)	=	Amount of oil to be added (liters) (minus sign denotes no oil to be added)
(b) When the oil inside the oil separator is recovered	Total amount of oil recovered (liters) (oil in compressor, oil separator, etc.)	-	8.2 l (PC unit) 4.6 l (AD unit)	=	Amount of oil to be added (liters) (minus sign denotes no oil to be added)

[Air Purging with a Vacuum Pump] (Ref. Fig. A)

1. When the need to perform an operation involving oil refilling arises, connect an oil tank to the end of valve V3 as shown in the Fig. (A) on page 19.
2. Close valve V9 and open valves V3 and V7, and run the vacuum pump. (The valves provided on both sides of the oil tank are set to the closed position.)
3. Continue with Air Purging with a Vacuum Pump until the vacuum low-pressure gauge reads 133.3 Pa (1 mmHg).
4. Upon completion of Air Purging with a Vacuum Pump, close valve V7 and stop the vacuum pump.

[Refilling the oil] (Ref. Fig. A)

Set the outdoor unit side of the valve provided on the oil tank connected to V3 to the closed position, and refill the amount of oil to be added inside the unit. If the oil fails to be refilled, apply refrigerant pressure from the reverse side.

Close valves V1 and V2, and open valve V8 and the valves provided on the oil tank. Upon completion, close all of these valves.

(Use a weighing scale. The specific gravity is 0.85 or so.)

[Refilling the refrigerant] (Ref. Fig. A)

If refrigerant needs to be refilled, open valves V1, V2 and V8, and close the valves provided on the oil tank and valve 3.

If the refrigerant fails to be refilled, run another outdoor unit, open valve V5 and close valves V1 and V2.

In this case, refill the refrigerant in the form of a gas. (Use a weighing scale. This job arises mainly when the ASTM No. of the oil is 4 or above.)

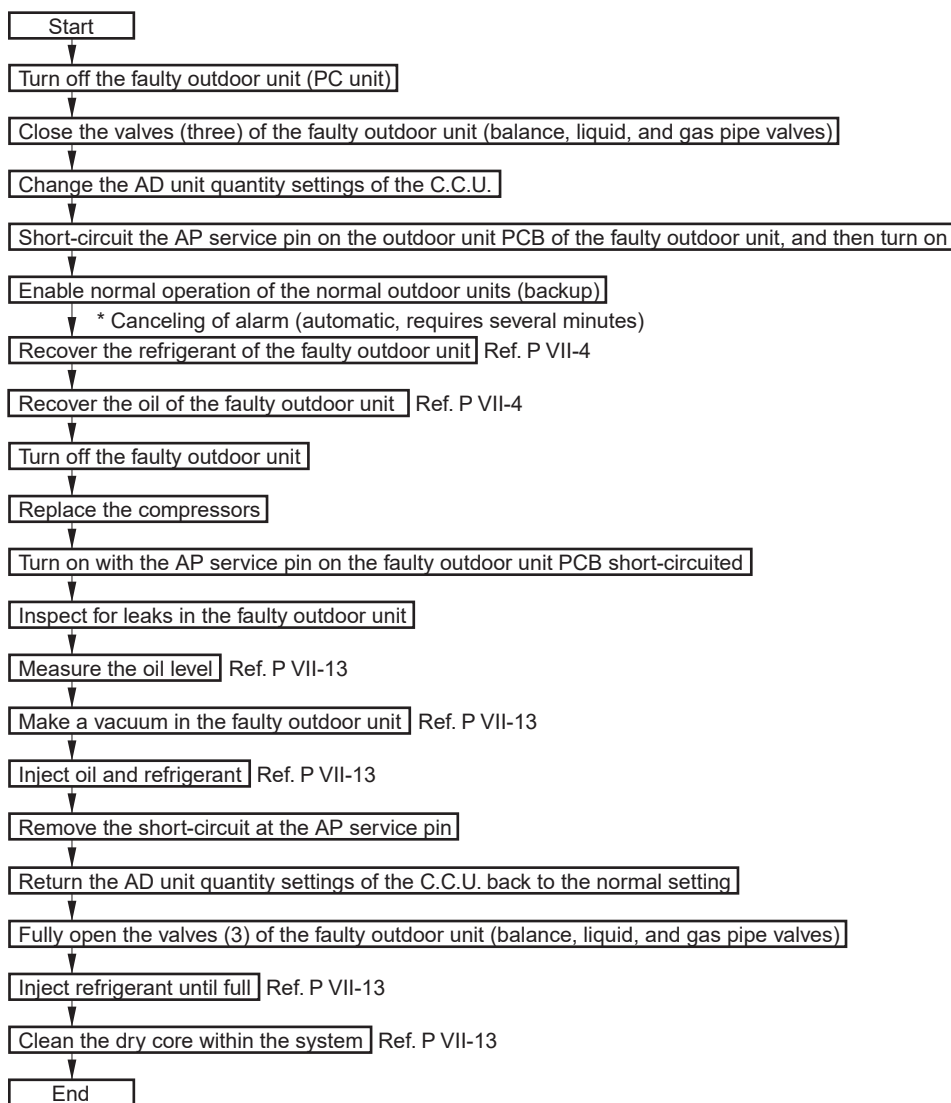

If the refrigerant cannot be refilled by taking the steps above, set all the outdoor units to the operation enable mode, then run all the units and follow the same steps as for refilling the gas.

1. Compressors

1-5. Replacing the Compressors (Three) of the PC Unit

* Never attempt to recover the refrigerant or oil of the faulty unit (PC unit) in another unit (AD unit). See the flowchart in “1-1. Judging whether a compressor needs to be replaced” and Fig. A (P19).

1874_M_1

NOTE

1. Ref. P VI-10, Backup Operation, under Control Functions.
2. When the AP service pin is short-circuited, the compressors and fans of the faulty unit (PC unit) are stopped, the solenoid valves and electronic expansion valves are fully opened, and all transmission is stopped.
3. Be sure to first check the injection amount of the refrigerant and oil, and then check the recovery amount.
4. If the short-circuit of the AP service pin is removed when the power is left on, transmission with the C.C.U. is restarted.
5. Even if an alarm (E26) has occurred, operation is restarted when the unit quantity setting is returned to normal.
The power does not need to be turned on and off again.
6. Perform immediately once the oil and refrigerant are injected.
7. Perform this operation if you were unable to inject the specified amount using the normal injection procedure.

1. Compressors

(1) Vacuum and Oil and Refrigerant Injection

[Measurement of oil amount]

Measure the oil amount in the faulty compressor and the oil amount recovered in the oil separator to determine the amount of new oil to be added.

Total amount of recovered oil (ℓ) (two compressors and oil separator)	-	8.2 ℓ (PC unit)	=	Amount of oil to be added (ℓ) (If the result is negative, no oil needs to be added.)
---	---	-----------------	---	--

[Vacuum]

1. Close the V9 valve, open the V3 and V7 valves, and start vacuum pump operation. (Both oil tank valves are closed.) (The V1 and V2 valves are open, the V5, V6, and V8 valves are closed, the balance pipe valves ① are closed, and ② is half-way open.)
2. Make a vacuum so that the vacuum low-pressure gauge reaches 133.3 Pa (1 mmHg).
3. Once this is reached, close the V7 valve, and then stop the vacuum pump.

[Oil injection]

Refer to “(2) Air Purging with a Vacuum Pump, refilling the oil/refrigerant” (P VII-11).

[Refrigerant injection]

Inject an amount equal to the amount recovered by the refrigerant recovery device plus 0.5 kg.

1. Open the V1, V2, and V8 valves, and close the oil tank valves and V3 valve. If all of the oil cannot be injected, operate another outdoor unit, and inject from the low-pressure discharge outlet of the operation unit in gaseous form. (Use the weighing scale.) If you cannot finish injection using this method, enable operation in all of the outdoor units, and then operate all of the outdoor units, and perform injection using this gas injection method.

(2) Cleaning of the Dry Cores in the System

One cause of repeated burning and other faults in compressors in the same piping system is acid, sludge, carbon, or other substances remaining in the refrigeration cycle. This is often due to inadequate cleaning. Perform cleaning properly by following the procedure below.

● When a ball valve is installed at the outdoor unit side

Install the service pipes as shown in Fig. B (P20).

1. Operate all of the outdoor units (either cooling or heating operation is OK).
2. Close the liquid pipe valve and ball valve of the outdoor unit where the dry core is to be mounted.
3. Immediately close the V1 valve, and then once operation is performed for 10 seconds, stop the outdoor unit. (The pipe contents are pumped down inside the piping.)
4. When the outdoor unit stops, close the V1 valve.
5. Remove the pipe between the liquid pipe valve and ball valve, and then mount the designated dry core. (This varies according to the specific model. This uses the flare connection method.)
6. Inspect for leaks in the pipe where the dry core is mounted (nitrogen pressure: approx. 1.96 MPa (20 kg/cm²)).
7. Make a vacuum in the pipe where the dry core is mounted (133.3 Pa (1 mmHg)).
8. Open the liquid pipe valve and ball valve.
9. Turn on the outdoor units.
10. Perform the above procedure for each outdoor unit.
11. Run each outdoor unit in this state for about three hours.
12. Follow the procedure above, and replace each dry core with a new one.
13. For the second time in this state, operate each outdoor unit for about 20 minutes.
14. Extract a small amount of oil, and check its smell, color, and overall appearance. If it meets the designated criteria, remove each dry core to complete the procedure. If the oil does not meet the designated criteria, replace each dry core with new ones again. Repeat this procedure until the oil meets the designated criteria.

1. Compressors

● When a ball valve is not installed at the outdoor unit side

The refrigerant inside all indoor units and the pipes between all units must be pumped down to the outdoor unit side. The pumping down capacity of this outdoor unit is approximately 10 kg in this system. As a result, another refrigerant recovery device is always necessary. Perform cleaning properly by following the procedure below. Fig. C (P21). The outdoor units are pumped down in the order of (1) AD unit and then (2) PC unit.

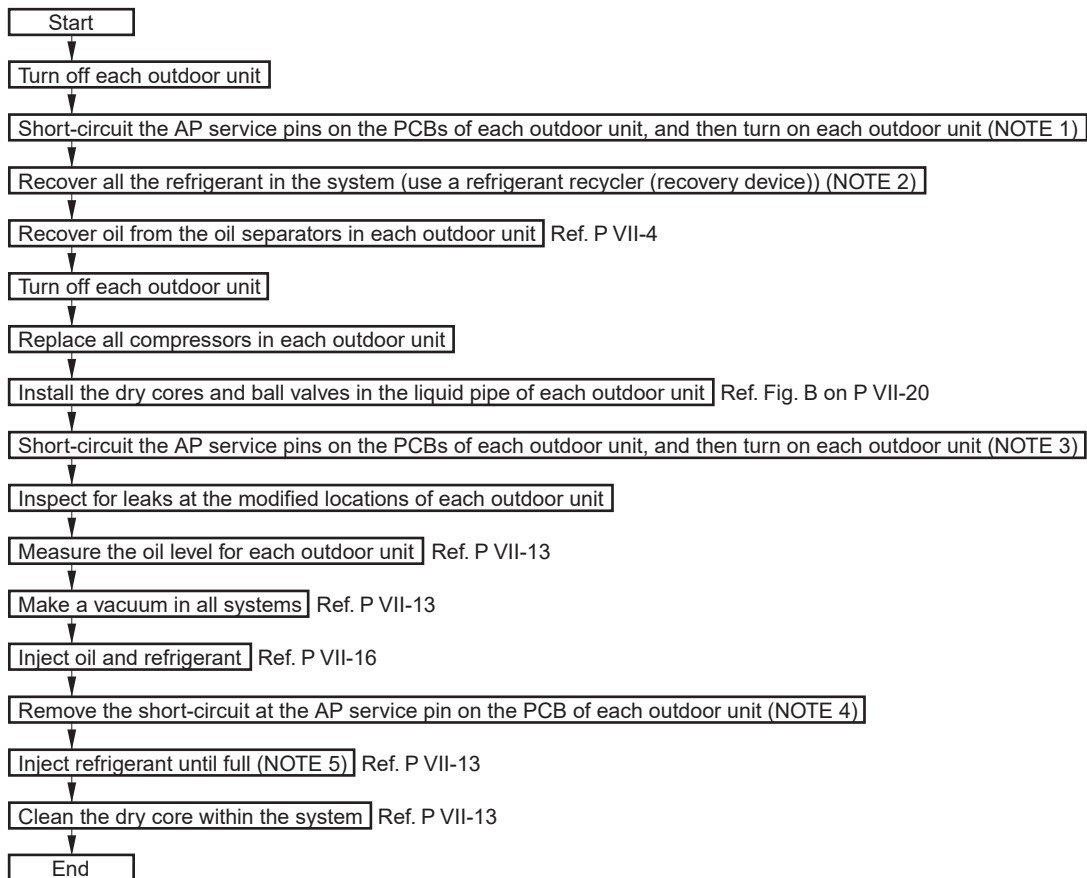

1. As shown in the figure, install a pressure gauge (high-pressure, low-pressure) at the outdoor units where the refrigerant will be pumped down.
2. Fully close the liquid pipe valves of the outdoor units where the refrigerant will be pumped down.
3. Stop the unit when the high-pressure gauge of the unit where the refrigerant is being recovered reaches 2.45 MPa (25 kg/cm²). (All Stop)
 - * Stopping procedures (two examples)
 - a) Make an instantaneous short-circuit at the operation stop pin (CN024-2P) on the C.C.U.
 - b) Pull the temperature thermistor connector unit on the outdoor unit control PCB from the PCB. (Any PCB can be used as long as it is not a discharge temperature PCB. Never pull by grasping the lead wires.)
4. Immediately fully close the gas pipe valves of the outdoor units where the refrigerant were pumped down.
5. Remove the inter unit wiring between the units of the outdoor PC and AD units where the refrigerant has been pumped down.
6. Set the AD unit quantity setting DIP switch (S006) on the C.C.U. to the number of outdoor units where the pumping down of the refrigerant has not been completed.
7. Operate the remaining outdoor units in cooling mode. (Cooling operation is performed also when the lower 2P pin of the cooling/heating selector pin (CN022-3P) on the C.C.U. is instantaneously short-circuited.)
8. In the next steps, repeat pumping down for each outdoor unit using the procedure described above. When pumping down for all the outdoor units is completed, prepare the refrigerant recovery device. (Although this varies depending on the pipe length at the site, approximately 10 to 40 kg of refrigerant is recovered.)
9. Simultaneously recover the refrigerant in the indoor units and in the pipes between units from all of the outdoor unit liquid pipe and gas pipe valve service ports.

Fully close the valves of the outdoor unit, and leave the indoor and outdoor units in their stopped status. Since the recovered refrigerant will later be used for charging, do not mix it with other recovered refrigerant.
10. Perform refrigerant recovery operation until the refrigerant recovery device low-pressure switch is activated. (For information about refrigerant recovery device operation, refer to the operation manual of the respective device.)
11. Release the small amount of residual gas refrigerant into a safe location.
12. As shown in Fig. C (P21), install the liquid pipe ball valve and dry core of the outdoor units. (The size varies according to the specific model. This uses the flare connection method.) Open the ball valve. Remove the dry core mounted to the service pipe.
13. Inspect for leaks in the pipe where the ball valve and dry core are mounted (nitrogen pressure: approx. 1.96 MPa (20 kg/cm²))
14. Make a vacuum inside the indoor unit and unit pipes.
15. Inject the recovered refrigerant into the liquid pipe side. If all of the refrigerant cannot be injected, inject the refrigerant into the low-pressure side in gaseous state after operation is started later. Be sure to always inject only the amount of recovered refrigerant. Also, inject new refrigerant if the refrigerant has a pungent, burning smell.
16. Fully open the liquid pipe valves of all outdoor units. Operate all units.
17. Refer to "(1) When a ball valve is installed at the outdoor unit side" above for the subsequent procedure.

1. Compressors

1-6. Procedure for Replacing All Compressors in the Same System

Always recover all the refrigerant and oil in the same system without releasing them into the open air. Perform operations according to the flowchart below. Never reuse the recovered refrigerant and oil.

1875_M_1

NOTE

1. When the AP service pin is short-circuited, the compressors and fans are stopped, the solenoid valves and electronic expansion valves are fully opened, and all transmission is stopped.
2. **Be sure to first check the injection amount, and then check the recovery amount.**
3. **Always make the short-circuit before turning on the power.**
4. If the short-circuit of the AP service pin is removed when the power is left on, transmission with the C.C.U. is restarted.
5. Perform this operation if you were unable to inject the specified amount using the normal injection procedure.

1. Compressors

(1) Injection of Oil and Refrigerant

[Oil injection]

Inject the oil amount below into each model from the oil removal service port of each model.

2.4 l

[Refrigerant injection]

1. Find the refrigerant injection amount using the formula below.

$$\begin{array}{|c|} \hline \text{Refrigerant} \\ \text{injection amount} \\ \text{(kg) (entire system)} \\ \hline \end{array} = \begin{array}{|c|} \hline \text{Total default refrigerant} \\ \text{injection amount for all} \\ \text{outdoor unit models} \\ \hline \end{array} + \begin{array}{|c|} \hline \text{Additional refrigerant} \\ \text{charge amount in the} \\ \text{on-site pipes} \\ \hline \end{array}$$

* The default refrigerant injection amount for each model is written on the name plate affixed to each unit.

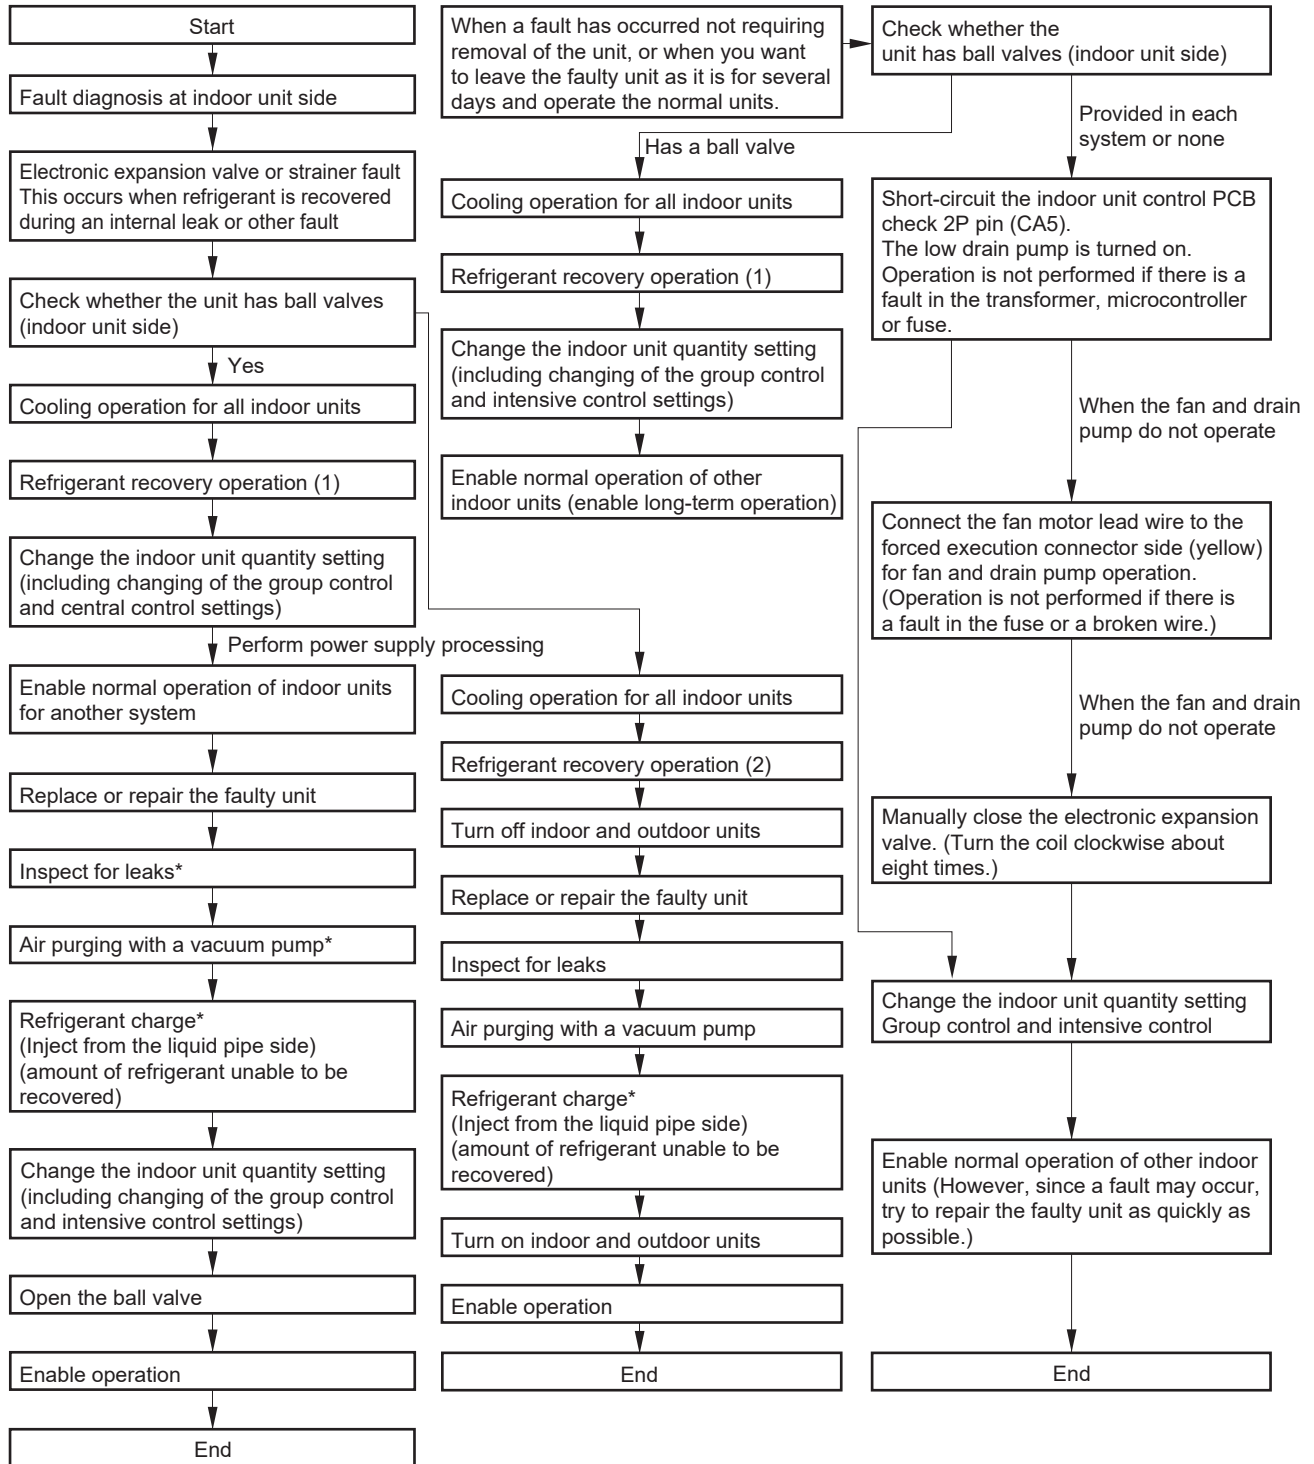

2. Inject refrigerant from the liquid pipe valve of each model.

7

2. Indoor Units

2-1. Refrigerant recovery when a fault occurs in the indoor unit

The procedure for refrigerant recovery when replacing or repairing an indoor unit due to a faulty refrigerant recovery circuit or other cause is shown below. Be sure to perform this procedure correctly.

* Performed from the service port of the indoor unit-side ball valve

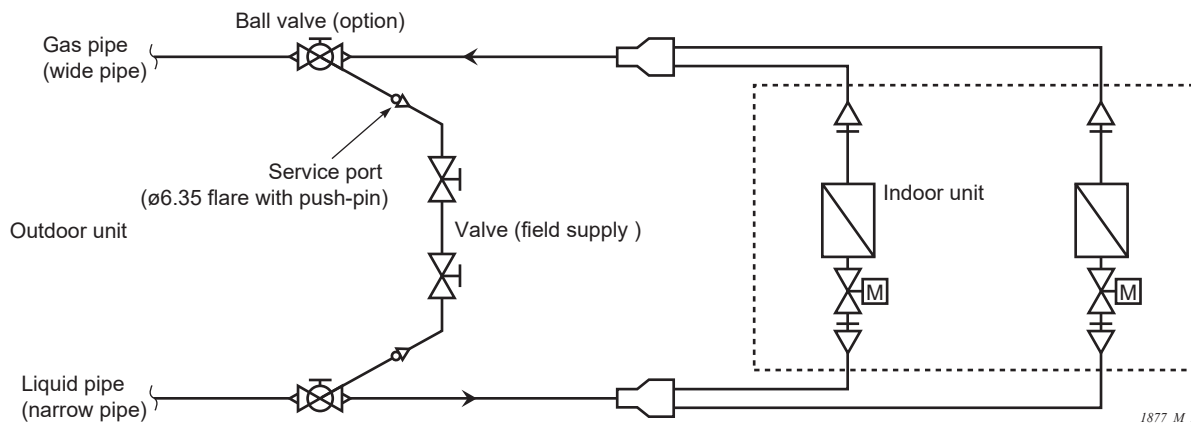

2. Indoor Units

2-2. Refrigerant Recovery Operation

(When a ball valve is installed)

Cooling operation

- ① Fully close the ball valve at the liquid pipe side.
- ② As shown in the figure, pass the ball valves on the liquid pipe and gas pipe sides through the respective service port (\varnothing 6.35 flare with push-pin) so that the passages are joined. (Perform an air purge using a charge hose or other equipment.)
- ③ Operate for 10 to 20 minutes in this state.
- ④ Fully close the ball valve on the gas pipe side.
- ⑤ Release the small amount of residual refrigerant in the indoor unit to a safe location.

Refrigerant Recovery Operation

(When a ball valve is not installed)

- * Refer to P VII-13, Cleaning of Dry Cores in the System, when replacing the compressors.

■ P.C.B. (CR-X253GH) for indoor units

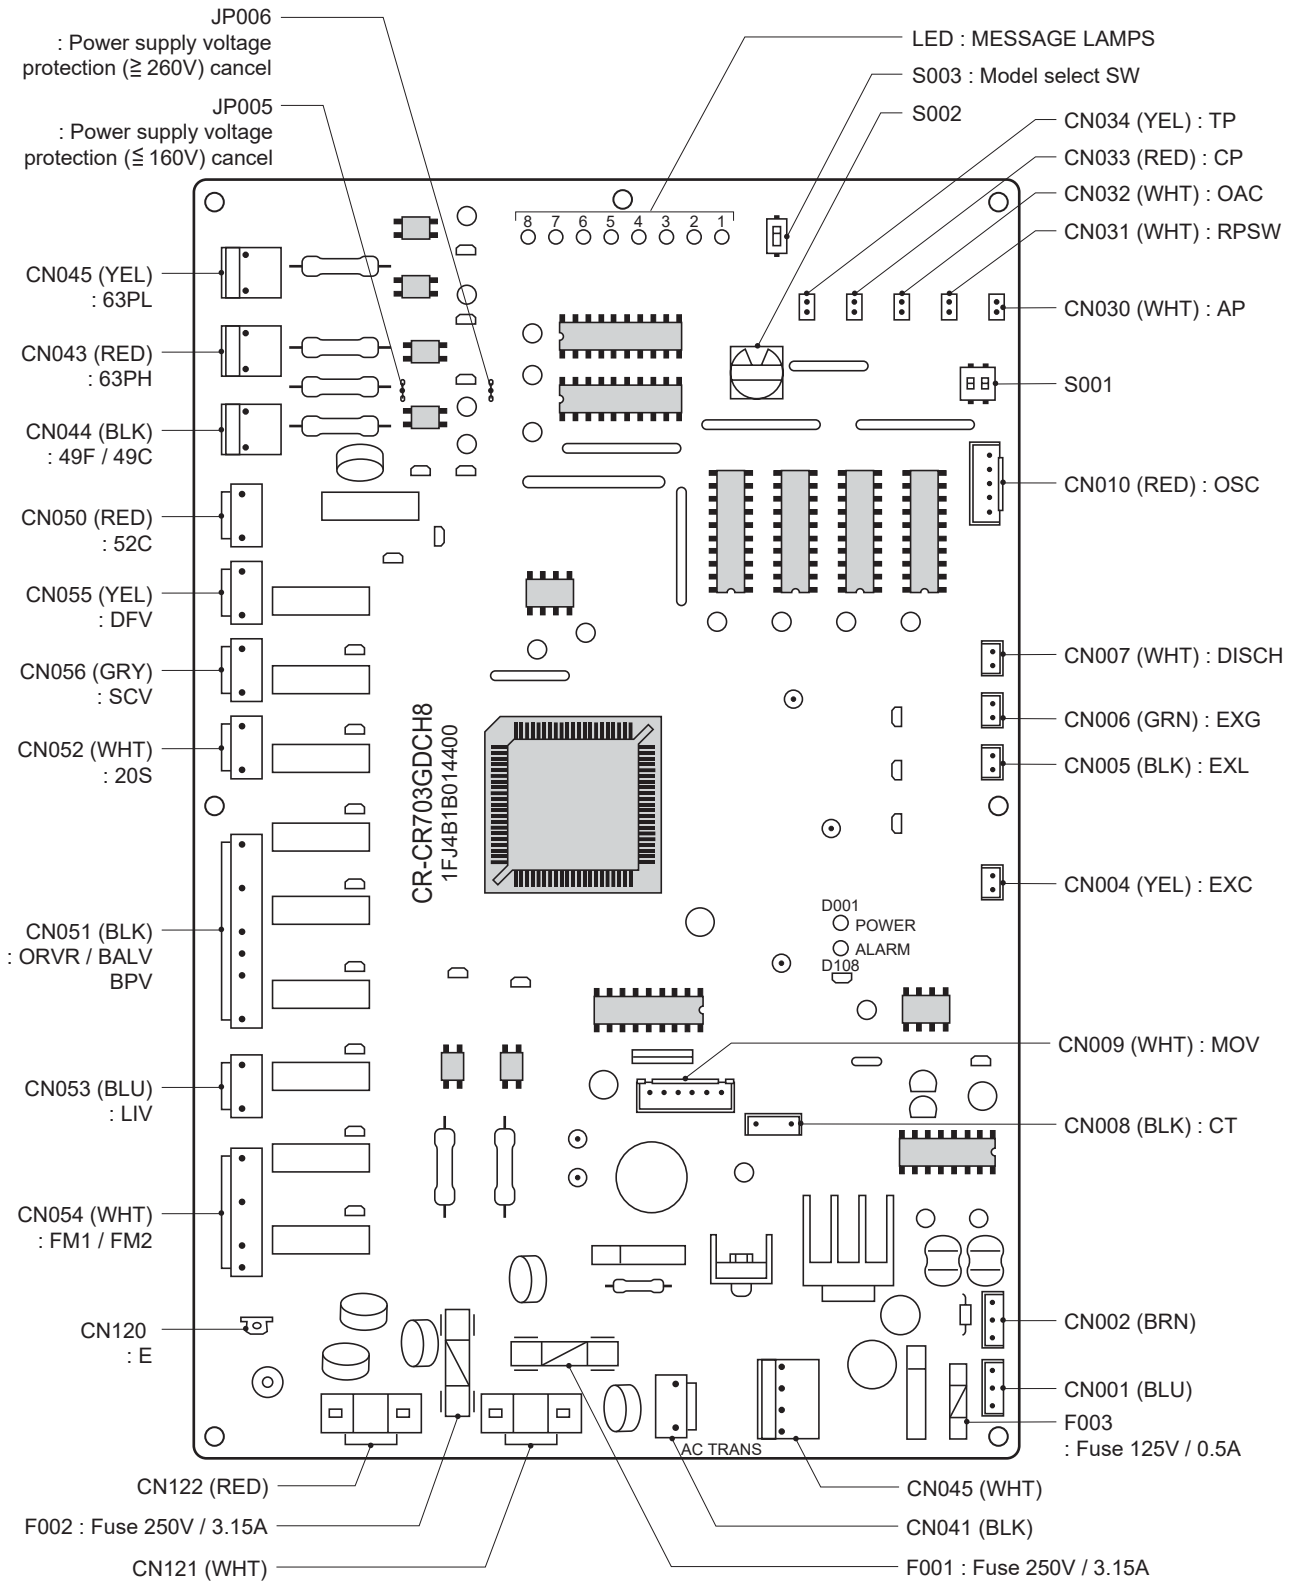

1208_THS_1

Note when replacing the indoor unit PCB

When replacing the indoor unit PCB for service, remove the *E²P-ROM of the original PCB then attach it to the new PCB since the original E²P-ROM has it's own data (ex. indoor unit address) to identify the unit.
